(54) Title: ETHER DERIVATIVES USEFUL AS INHIBITORS OF PDE4 ISOZYMES

(57) Abstract: Compounds useful as inhibitors of PDE4 in the treatment of diseases regulated by the activation and degranulation of eosinophils, especially asthma, chronic bronchitis, and chronic obstructive pulmonary disease, of the formula (I) wherein j is 0 or 1, provided that when j is 0, n must be 2; k is 0 or 1; m is 1, 2, or 3; n is 1 or 2; W¹ and W² are -O-; -S(=O)_t-, where t is 0, 1, or 2, or -N(R³)₂-, Y is =C(R¹)₂-, or -[N⇒(O)]_k- where k is 0 or 1; R¹ is -H, -F, -Cl, -CN, -NO₂, -(C₁-C₄) alkyl, -(C₂-C₄) alkynyl, fluorinated-(C₁-C₃) alkyl, fluorinated-(C₁-C₃) alkoxy, -OR¹⁶, or -C(=O)NR²²₂R²²₂; R^A and R^B are -H, -F, -Cl, -CN, -(C₁-C₄) alkyl, -(C₃-C₇) cycloalkyl, phenyl, or benzyl substituted by 0-3 R¹⁰, or R^A and R^B are taken together to form a spiro moiety of the formula (Ia) where r and s are 0-4 provided r + s is ≥ 1 but not > 5; and X^A is -CH₂-, -CHF-, -CF₂-, -NR¹⁵-, -O-, or -S(=O)_t-, where t is 0, 1; R^C and R^D are the same as R^A and R^B except that one of them must be -H; R¹ and R² are -H, -F, -Cl, -CN, -NO₂, -(C₁-C₄) alkyl, -(C₂-C₄) alkynyl, fluorinated-(C₁-C₃) alkyl, -OR¹⁶, or -C(=O)NR²²₂R²²₂; R³ is -H, -(C₁-C₃) alkyl, phenyl, benzyl, or -OR¹⁶; R⁴, R⁵ and R⁶, D, J₁ and J₂ are defined in the application.

**ETHER DERIVATIVES USEFUL AS
INHIBITORS OF PDE4 ISOZYMES**

1.0 REFERENCE TO RELATED APPLICATIONS

Reference is made to co-pending International application and US application based thereon, Serial No. PCT/IB98/00315, both filed March 10, 1998 (Attorney Docket No. PC9762A), and published as WO 98/45268 on October 15, 1998; claiming priority from application Serial No. 60/043403 filed April 4, 1997 (Attorney Docket No. PC9762), now
10 abandoned; which discloses nicotinamide derivatives having biological activity as inhibitors of PDE4 isozymes, and thus being useful in the treatment of inflammatory, respiratory and allergic diseases and conditions. Nothing that is disclosed in the above-mentioned applications would teach the person of ordinary skill in the pertinent art the novel compounds of the present invention or their unexpectedly high level of inhibitory selectivity for PDE 4
15 isozymes.

Reference is also made to copending application Serial No. 09/345,185 filed June 30, 1999 (Attorney Docket No. PC10096A); claiming priority from application Serial No. 60/105,120 filed October 21, 1998 (Attorney Docket No. PC10096), which discloses compounds and processes for preparing N-substituted nicotinamide derivatives. However,
20 the disclosed compounds and processes are not the same as those of the present invention.

Reference is further made to copending applications filed of even date with the instant application, Attorney Docket Nos. PC11712; PC11848; PC11893; PC11894; PC11895; and PC11897, which involve other classes of nicotinamide derivatives useful as inhibitors of PDE4 isozymes. The disclosures of all of said copending applications are
25 incorporated herein by reference in their entireties.

2.0 BACKGROUND OF THE INVENTION

The 3',5'-cyclic nucleotide phosphodiesterases (PDEs) comprise a large class of enzymes divided into at least eleven different families which are structurally, biochemically and pharmacologically distinct from one another. The enzymes within each family are
30 commonly referred to as isoenzymes, or isozymes. A total of more than fifteen gene products is included within this class, and further diversity results from differential splicing and post-translational processing of those gene products. The present invention relates to the four gene products of the fourth family of PDEs, i.e., PDE4A, PDE4B, PDE4C, and PDE4D, and their inhibition, including selective inhibition of PDE4D. These enzymes are collectively
35 referred to as being isoforms or subtypes of the PDE4 isozyme family. Further below will be found a more detailed discussion of the genomic organization, molecular structure and

- 2 -

enzymatic activity, differential splicing, transcriptional regulation and phosphorylation, distribution and expression, and selective inhibition of the PDE4 isozyme subtypes.

The PDE4s are characterized by selective, high affinity hydrolytic degradation of the second messenger cyclic nucleotide, adenosine 3',5'-cyclic monophosphate (cAMP), and by sensitivity to inhibition by rolipram. A number of selective inhibitors of the PDE4s have been discovered in recent years, and beneficial pharmacological effects resulting from that inhibition have been shown in a variety of disease models. See, e.g., Torphy *et al.*, *Environ. Health Perspect.* 102 Suppl. 10, 79-84, 1994; Duplantier *et al.*, *J. Med. Chem.* 39 120-125, 1996; Schneider *et al.*, *Pharmacol. Biochem. Behav.* 50 211-217, 1995; Banner and Page, *Br. J. Pharmacol.* 114 93-98, 1995; Barnette *et al.*, *J. Pharmacol. Exp. Ther.* 273 674-679, 1995; Wright *et al.*, "Differential *in vivo* and *in vitro* bronchorelaxant activities of CP-80633, a selective phosphodiesterase 4 inhibitor," *Can. J. Physiol. Pharmacol.* 75 1001-1008, 1997; Manabe *et al.*, "Anti-inflammatory and bronchodilator properties of KF19514, a phosphodiesterase 4 and 1 inhibitor," *Eur. J. Pharmacol.* 332 97-107, 1997; and Ukita *et al.*, "Novel, potent, and selective phosphodiesterase-4 inhibitors as antiasthmatic agents: synthesis and biological activities of a series of 1-pyridynaphthalene derivatives," *J. Med. Chem.* 42 1088-1099, 1999. Accordingly, there continues to be considerable interest in the art with regard to the discovery of further selective inhibitors of PDE4s.

The present invention is also concerned with the use of selective PDE4 inhibitors for the improved therapeutic treatment of a number of inflammatory, respiratory and allergic diseases and conditions, but especially for the treatment of asthma; chronic obstructive pulmonary disease (COPD) including chronic bronchitis, emphysema, and bronchiectasis; chronic rhinitis; and chronic sinusitis. Heretofore in the art, however, the first-line therapy for treatment of asthma and other obstructive airway diseases has been the nonselective PDE inhibitor theophylline, as well as pentoxifylline and IBMX, which may be represented by Formulas (0.0.1), (0.0.2), and (0.0.3), respectively:

(0.0.2)

- 3 -

(0.0.3)

Theophylline, which has the PDEs as one of its biochemical targets, in addition to its well characterized bronchodilatory activity, affects the vasculature of patients with increased pulmonary artery pressure, suppresses inflammatory cell responses, and induces apoptosis of eosinophils. Theophylline's adverse events, most commonly cardiac dysrhythmias and nausea, are also mediated by PDE inhibition, however, leading to the search for more selective inhibitors of PDEs that are able to suppress both immune cell functions *in vitro* and allergic pulmonary inflammation *in vivo*, while at the same time having improved side-effect profiles. Within the airways of patients suffering from asthma and other obstructive airway diseases, PDE4 is the most important of the PDE isozymes as a target for drug discovery because of its distribution in airway smooth muscle and inflammatory cells. Several PDE4 inhibitors introduced to the art thus far have been designed to have an improved therapeutic index concerning the cardiovascular, gastrointestinal, and central nervous system side effects of the above-mentioned nonselective xanthines.

Airflow obstruction and airway inflammation are features of asthma as well as COPD. While bronchial asthma is predominantly characterized by an eosinophilic inflammation, neutrophils appear to play a major role in the pathogenesis of COPD. Thus, PDEs that are involved in smooth muscle relaxation and are also found in eosinophils as well as neutrophils probably constitute an essential element of the progress of both diseases. The PDEs involved include PDE3s as well as PDE4s, and bronchodilating inhibitors have been discovered which are selective PDE3 inhibitors and dual PDE3/4 selective inhibitors. Examples of these are milrinone, a selective PDE3 inhibitor, as well as zardaverine and benafentrine, both dual PDE3/4 selective inhibitors, which may be represented by Formulas (0.0.4), (0.0.5), and (0.0.6), respectively:

(0.0.5)

- 4 -

Benafentrine

(0.0.6)

However, benafentrine results in bronchodilation only when administered by
 5 inhalation, and zardaverine produces only a modest and short-lived bronchodilation. Milrinone, a cardiotonic agent, induces short-lived bronchodilation and a slight degree of protection against induced bronchoconstriction, but has marked adverse events, e.g., tachycardia and hypotension. Unsatisfactory results have also been obtained with a weakly selective PDE4 inhibitor, tibenelast, and a selective PDE5 inhibitor, zaprinast, which may be
 10 represented by Formulas (0.0.7) and (0.0.8):

Tibenelast
(0.0.7)

Zaprinast

(0.0.8)

More relative success has been obtained in the art with the discovery and development of
 15 selective PDE4 inhibitors.

In vivo, PDE4 inhibitors reduce the influx of eosinophils to the lungs of allergen-challenged animals while also reducing the bronchoconstriction and elevated bronchial responsiveness occurring after allergen challenge. PDE4 inhibitors also suppress the activity of immune cells, including CD4⁺ T-lymphocytes, monocytes, mast cells, and basophils;
 20 reduce pulmonary edema; inhibit excitatory nonadrenergic noncholinergic neurotransmission (eNANC); potentiate inhibitory nonadrenergic noncholinergic neurotransmission (iNANC); reduce airway smooth muscle mitogenesis; and induce bronchodilation. PDE4 inhibitors also suppress the activity of a number of inflammatory cells associated with the pathophysiology of COPD, including monocytes/macrophages, CD8⁺ T-lymphocytes, and neutrophils. PDE4
 25 inhibitors also reduce vascular smooth muscle mitogenesis and, and potentially interfere with the ability of airway epithelial cells to generate pro-inflammatory mediators. Through the release of neutral proteases and acid hydrolases from their granules, and the generation of reactive oxygen species, neutrophils contribute to the tissue destruction associated with

- 5 -

chronic inflammation, and are further implicated in the pathology of conditions such as emphysema.

Selective PDE4 inhibitors which have been discovered thus far that provide therapeutic advantages include SB-207,499, identified as ARIFLO®, which may be represented by Formula (0.1.9):

SB-207,499 (0.1.9)

SB-207,499, administered orally at dosages of 5, 10, and 15 mg *b.i.d.*, has produced significant increases in trough FEV₁ (forced expiratory volume in 1 second) from placebo at week 2 of a study involving a large number of patients. Another potent, selective PDE4 inhibitor, CDP840, has shown suppression of late reactions to inhaled allergen after 9.5 days of oral administration at doses of 15 and 30 mg in a group of patients with bronchial asthma. CDP840 may be represented by Formula (0.0.9):

CDP840 (0.0.9)

PDEs have also been investigated as potential therapy for obstructive lung disease, including COPD. In a large study of SB-207,499 in patients with COPD, the group of patients receiving 15 mg *b.i.d.* has experienced a progressive improvement in trough FEV₁, reaching a maximum mean difference compared with placebo of 160 mL at week 6, which represents an 11% improvement. See Compton *et al.*, "The efficacy of Ariflo (SB207499), a second generation, oral PDE4 inhibitor, in patients with COPD," *Am. J. Respir. Crit. Care Med.* 159, 1999. Patients with severe COPD have been observed to have pulmonary hypertension, and decreases in mean pulmonary artery pressure under clinical conditions have been achieved by oral administration of the selective PDE3 inhibitors milrinone and enoximone. Enoximone has also been shown to reduce airway resistance in patients hospitalized with decompensated COPD. See Leeman *et al.*, *Chest* 91 662-6, 1987. Using selective PDE3 inhibition by metapizone and selective PDE5 inhibition by zaprinast, it has been shown that combined inhibition of PDE 3 and 5 exerts a relaxation of pulmonary artery rings which corresponds broadly to the pattern of PDE isozymes found in the pulmonary artery smooth muscle. See Rabe *et al.*, *Am. J. Physiol.* 266 (LCMP 10): L536-L543, 1994. The structures of milrinone and zaprinast are shown above as Formulas (0.0.4) and (0.0.8), respectively.

- 6 -

The structures of enoximone and motapizone may be represented by Formulas (0.0.10) and (0.0.11), respectively:

Enoximone
(0.0.10)

Motapizone

(0.0.11)

5

The effects of PDE4 inhibitors on various inflammatory cell responses can be used as a basis for profiling and selecting inhibitors for further study. These effects include elevation of cAMP and inhibition of superoxide production, degranulation, chemotaxis, and tumor necrosis factor alpha (TNF α) release in eosinophils, neutrophils and monocytes. PDE4 inhibitors may induce emesis, *i.e.*, nausea and vomiting, which, as expected, is an adverse effect. The emesis adverse effect became apparent when PDE4 inhibitors were first investigated for CNS indications such as depression, when rolipram and denbufylline were used in clinical trials. Rolipram and denbufylline may be represented by Formulas (0.0.12) and (0.0.13), respectively:

10

Rolipram
(0.0.12)

Denbufylline

(0.0.13)

15

The mechanism(s) by which PDE4 inhibitors may potentially induce emesis is/are uncertain, but a study of the PDE4 inhibitor Ro-20-1724 suggests that nausea and vomiting are at least partially mediated by the emesis centers in the brain. Gastrointestinal adverse events may be caused by local effects, *e.g.*, rolipram is a very potent stimulator of acid secretion from gastric parietal cells, and the resulting excess acid, by producing local irritation, may exacerbate gastrointestinal disturbances. Ro-20-1724 may be represented by Formula (0.0.14):

20

Ro-20-1724

(0.0.14)

25

- 7 -

Efforts to minimize or eliminate the above-mentioned adverse events sometimes associated with PDE4 inhibitors have included creating inhibitors which do not penetrate the central nervous system, and administering PDE4 inhibitors by inhalation rather than orally.

5 With regard to the PDE4 subtypes, A, B, C, and D, it has been found that PDE4C is usually less sensitive to all inhibitors; whereas, with respect to the subtypes A, B, and D, there is as yet no clear evidence of inhibitor specificity, which is defined as a 10-fold difference in IC_{50} values. While most inhibitors, especially RS-25,344, are more potent against PDE4D, this does not amount to selectivity. RS-25,344 may be represented by Formula (0.0.15):

10

RS-25,344

(0.0.15)

On the other hand, there is a stereoselective effect on the elevation of cAMP in a range of cell types, which has been demonstrated with the results of an investigation of CDP840, shown above as Formula (0.0.9), and its less active enantiomer CT-1731, which is represented by Formula (0.0.16):

15

CT-1731

(0.0.16)

20 It has been known for some time that rolipram had the ability to interact with a high-affinity binding site on brain membranes, and it was later established in the art that this high-affinity rolipram binding site (S_r), which is distinct from the catalytic site (S_c), exists in a truncated recombinant PDE4A and a full-length recombinant PDE4B. More recently, S_r has been identified on all four PDE4 subtypes. See Hughes *et al.*, *Drug Discovery Today* 2(3) 89-101, 1997. The presence of S_r appears to have a profound effect on the ability of certain inhibitors such as rolipram and RS-25,344 to inhibit the catalytic activity of PDE4 isozymes.

25 The impact of residues on inhibitor binding is also significant. A single amino acid substitution (alanine for aspartate) in the catalytic region of PDE4B has been shown to be critical for inhibition by rolipram, and this appears to be a class effect because related inhibitors RP-73,401 and Ro-20-1724 also lose potency on the mutant enzyme. However, the role of binding of inhibitors to the S_c or to the S_r in terms of elevation of cAMP and inhibition of cell responses, is not fully understood at the present time.

- 8 -

RP-73,401, in guinea-pig studies, has been found to be active in (1) the inhibition of antigen-induced lung eosinophilia and eosinophil peroxidase (EPO), Banner, K.H., "The effect of selective phosphodiesterase inhibitors in comparison with other anti-asthma drugs on allergen-induced eosinophilia in guinea-pig airways," *Pulm. Pharmacol.* **8** 37-42, 1995; (2) antigen-induced bronchoalveolar lavage (BAL) eosinophilia, Raeburn *et al.*, "Anti-inflammatory and bronchodilator properties of RP73401, a novel and selective phosphodiesterase Type IV inhibitor," *Br. J. Pharmacol.* **113** 1423-1431, 1994; (3) antigen-induced airway eosinophilia and platelet activating factor- (PAF)- and ozone-induced airway hyper-responsiveness (AHR), Karlsson *et al.*, "Anti-inflammatory effects of the novel phosphodiesterase IV inhibitor RP73401," *Int. Arch. Allergy Immunol.* **107** 425-426, 1995; and (4) IL-5 induced pleural eosinophilia. Development of RP-73,401, piclamilast, has been discontinued. Piclamilast may be represented by Formula (0.0.17):

Piclamilast (RP-73,401)

(0.0.17)

A related series of compounds is represented by RPR-132294 and RPR-132703, which have been demonstrated in rat studies to have activity in the inhibition of antigen-induced bronchospasm; Escott *et al.*, "Pharmacological profiling of phosphodiesterase 4 (PDE4) inhibitors and analysis of the therapeutic ratio in rats and dogs," *Br. J. Pharmacol.* **123**(Proc. Suppl.) 40P, 1998; and Thuraiatnam *et al.*, "Biological activity and side effect profile of RPR-132294 and RPR-132703 – novel PDE4 inhibitors," *XVth EFMC Int. Symp. Med. Chem.*, 1998. The structure of RPR-132294 may be represented by Formula (0.0.18):

RPR-132294

(0.0.18)

Another compound whose development has been discontinued is WAY-PDA-641, flaminast, which in studies in the dog, has been found to be active in the inhibition of serotonin-induced bronchoconstriction. Flaminast may be represented by Formula (0.0.19):

- 9 -

Filaminast (WAY-PDA-641)

(0.0.19)

It has been suggested in the art that PDE4 inhibitors that have a high affinity at the S_r can be correlated with emesis and increased gastric acid secretion. RS-23,544, RP-73,401, and CP-80,633 elicit emesis and have a high affinity at the S_r . CDP840 and SB-207,499 have a comparatively low affinity at the S_r , but CDP840 has a significantly higher potency at the S_c than does SB-207,499. CDP840 has been demonstrated to provide significant inhibition of late-phase response in the treatment of asthma without any adverse events of nausea or headache. Another PDE4 inhibitor that has been shown to have adverse events of nausea and vomiting is BRL-61,063, also referred to as cipamfylline, which is described further below. The development of CDP840 has been discontinued, while CP-80,633, atizoram, has been advanced into clinical studies. CP-80,633 and BRL-61,063 may be represented by Formulas (0.0.20) and (0.1.12), respectively:

Atizoram (CP-80,633)
(0.0.20)Cipamfylline (BRL-61,063)
(0.1.12)

Another compound which is in development is LAS-31025, arofylline, which in guinea-pig studies, has been found to be active in the inhibition of antigen-induced bronchoconstriction; Beleta, B. J., "Characterization of LAS31025: a new selective PDE IV inhibitor for bronchial asthma," *Third Int. Conf. On Cyclic Nucleotide Phosphodiesterase: From Genes to Therapies*, Glasgow, UK, 1996, Abstract 73. LAS-31025, arofylline, may be represented by Formula (0.0.21):

- 10 -

Arofyline (LAS-31025)

(0.0.21)

A number of PDE4 inhibitors have been advanced in development. For example, the effects of V-11294A on LPS-stimulated *ex vivo* TNF release and PHA induced lymphocyte proliferation have been determined in a randomized, double-blind placebo-controlled study which has found that an oral dose of 300 mg is effective in reducing TNF levels and lymphocyte proliferation; Landells *et al.*, "Oral administration of the phosphodiesterase (PDE) 4 inhibitor, V11294A inhibits *ex-vivo* agonist-induced cell activation," *Eur. Resp. J.* 12(Suppl. 28) 362s, 1998; and Gale *et al.*, "Pharmacodynamic-pharmacokinetic (PD/PK) profile of the phosphodiesterase (PDE) 4 inhibitor, V11294A, in human volunteers," *Am. J. Respir. Crit. Care Med.* 159 A611, 1999.

The compound D4418 has been administered to healthy volunteers in a single escalating dose, randomized, placebo-controlled Phase I study; Montana *et al.*, "Activity of D4418, a novel phosphodiesterase 4 (PDE4) inhibitor, effects in cellular and animal models of asthma and early clinical studies," *Am. J. Respir. Crit. Care Med.* 159 A108, 1999. D4418 is a moderately potent PDE4 inhibitor with an IC_{50} of 200 nM. It has good oral absorption; a 200 mg dose provides a plasma C_{max} of 1.4 μ g/ml. D4418 has been discontinued from development due to its moderate potency, and has been replaced by the preclinical development candidate D4396.

V-11294A and D4418 may be represented by Formulas (0.0.22) and (0.0.23), respectively:

V-11294A
(0.0.22)

D4418

(0.0.23)

25

Another compound, CI-1018, has been evaluated in 54 subjects and no adverse events were reported at doses up to 400 mg; Pruniaux *et al.*, "The novel phosphodiesterase inhibitor CI-1018 inhibits antigen-induced lung eosinophilia in sensitized brown-norway rats - comparison with rolipram," *Inflammation* S-04-6, 1999. CI-1018 has been demonstrated to have good oral bioavailability (57% in the rat) and good oral potency of with an ED₅₀ of 5mg/kg in that same species. CI-1018 is a relatively weak PDE4 inhibitor with an IC₅₀ of 1.1μM in U937 cells. CI-1018 has also been identified as, or associated with as closely related in structure to, PD-168787, which in rat studies has been demonstrated to have activity in the inhibition of antigen-induced eosinophilia; Pascal *et al.*, "Synthesis and structure-activity relationships of 4-oxo-1-phenyl-3,4,6,7-tetrahydro-[1,4]-diazepino[6,7,1-hi]indolines: novel PDE4 inhibitors," 215th ACS, Dallas, USA, MEDI 50, 1998. Inferred structures for CI-1018 and PD-168787 belong to a diazepinone class whose nucleus may be represented by Formula (0.0.24):

15

(0.0.24)

The above-mentioned compounds have also been evaluated in animal models which demonstrate their PDE4 inhibition activity. For example, V-11294A, in guinea-pig studies, has been found to be active in the inhibition of antigen-induced bronchoconstriction; Cavalla *et al.*, "Activity of V11294A, a novel phosphodiesterase 4 (PDE4) inhibitor, in cellular and animal models of asthma," *Amer. J. Respir. Crit. Care Med*, 155 A660, 1997. D4418, in guinea-pig studies, has been found to be active in the inhibition of antigen-induced early and late phase bronchoconstriction and BAL eosinophilia; Montana, *et al.*, *ibid.* CI-1018, in rat studies, has been found to be active in the inhibition of antigen-induced eosinophilia; Burnouf, *et al.*, "Pharmacology of the novel phosphodiesterase Type 4 inhibitor, CI-1018," 215th ACS Nat. Meeting, MEDI 008, 1998.

20

Other compounds which have been advanced in development include CDC-3052, D-22888, YM-58997, and roflumilast, which may be represented by Formulas (0.0.27), (0.0.28), (0.0.29), and (0.0.30), respectively:

25

- 12 -

CDC-3052
(0.0.27)

D-22888

(0.0.28)

YM-58977
(0.0.29)

Roflumilast

(0.0.30)

CDC-3052 has been discontinued from development, but has been succeeded by very potent inhibitors of PDE4 such as the compound represented by Formula (0.0.31), and by the anti-inflammatory compound CDC-801 represented by Formula (0.0.32), respectively:

(0.0.31)

CDC-801

(0.0.32)

The compound of Formula (0.0.32) is reported to have IC_{50} values of 42 pM and 130 nM as an inhibitor of PDE4 and TNF production, respectively; Muller et al., "N-Phthaloyl beta-aryl-beta-amino derivatives: Potent TNF-alpha and PDE4 inhibitors," 217th American Chemical Society, Anaheim, Germany, MEDI 200, 1999; and Muller et al., "Thalidomide analogs and PDE4 inhibition," Bioorg. Med. Chem. Letts. 8 2669-2674, 1998.

CDC-801 is from a series of compounds based on thalidomide and has been developed primarily to improve the TNF- α inhibitory activity of thalidomide for the treatment of autoimmune diseases. Thalidomide may be represented by Formula (0.0.33):

- 13 -

Thalidomide

(0.0.33)

5 CDC-801 has also been studied for the treatment of Crohn's disease, a chronic
granulomatous inflammatory disease of unknown etiology commonly involving the terminal
ileum, with scarring and thickening of the bowel wall which frequently leads to intestinal
obstruction and fistula and abscess formation. Crohn's disease has a high rate of recurrence
after treatment.

10 YM-58997 has an IC_{50} value of 1.2 nM against PDE4; Takayama *et al.*, "Synthetic
studies on selective Type IV phosphodiesterase (PDE IV) Inhibitors," 214th American
Chemical Society, Las Vegas, USA, MEDI 245, 1997. YM-58997 has a 1,8-naphthyridin-2-
one structure, as does YM-976.

15 Roflumilast has been studied for the treatment of both COPD and asthma, and has
an IC_{50} value of 3.5 nM in standard *in vitro* guinea-pig models of asthma. The use of
roflumilast and a surfactant for the treatment of adult respiratory distress syndrome (ARDS)
has also been described.

20 AWD-12,281, which is now designated as loteprednol, has been shown to be active
in a rat model of allergic rhinitis, as described further below in a section which deals with
allergic rhinitis and the use of PDE4 inhibitors to treat it. AWD-12,281 may be represented by
Formula (0.0.34):

Loteprednol (AWD-12,281)

(0.0.34)

25 Compounds related in structure to CDP840, shown further above as Formula (0.0.9),
include L-826,141, which has been reported to have activity in a rat model of bronchitis;
Gordon *et al.*, "Anti-inflammatory effects of a PDE4 inhibitor in a rat model of chronic
bronchitis," *Am. J. Respir. Crit. Care Med.* 159 A33, 1999. Another such compound is related
in structure to those reported in Perrier *et al.*, "Substituted furans as inhibitors of the PDE4
enzyme," *Bioorg. Med. Chem. Letts.* 9 323-326, 1999, and is represented by Formula
30 (0.0.35):

- 14 -

Other compounds which been found to be very potent PDE4 inhibitors are those
5 represented by Formulas (0.0.36), (0.0.37), and (0.0.38):

Compounds have been created which combine PDE4 and matrix metalloproteinase
(MMP) inhibitory activity in a single molecule; Groneberg *et al.*, "Dual inhibition of
10 phosphodiesterase 4 and matrix metalloproteinases by an (arylsulfonyl)hydroxamic acid
template," *J. Med. Chem.* 42(4) 541-544, 1999. Two examples of such compounds are
represented by Formulas (0.0.39) and (0.0.40):

15 The respective IC_{50} values for the compounds of Formulas (0.1.36) and (0.1.37) using a
guinea-pig macrophage PDE4 assay were 1 nM and 30 nM.

The compounds identified as KF19514 and KF17625 have been shown in guinea-pig
studies to have activity in the inhibition of the following: histamine-induced and antigen-
induced bronchoconstriction; PAF-induced lung eosinophilia and antigen-induced BAL
20 eosinophilia; acetylcholine (ACh)-induced AHR; PAF-induced BAL eosinophilia and
neutrophilia, and AHR; antigen-induced bronchospasm; and anaphylactic

- 15 -

bronchoconstriction; Fujimura *et al.*, "Bronchoprotective effects of KF-19514 and cilostazol in guinea-pigs *in vivo*," *Eur. J. Pharmacol.* **327** 57-63, 1997; Manabe *et al.*, *Ibid.*; Manabe *et al.*, "KF19514, a phosphodiesterase 4 and 1 inhibitor, inhibits PAF-induced lung inflammatory responses by inhaled administration in guinea-pigs," *Int. Arch. Allergy Immunol.* **114** 389-399, 1997; Suzuki *et al.*, "New bronchodilators. 3. Imidazo[4,5-c][1,8]naphthyridin-4(5H)-ones," *J. Med. Chem.* **35** 4866-4874, 1992; Matsuura *et al.*, "Substituted 1,8-naphthyridin-2(1H)-ones as selective phosphodiesterase IV inhibitors," *Biol. Pharm. Bull.* **17**(4) 498-503, 1994; and Manabe *et al.*, "Pharmacological properties of a new bronchodilator, KF17625," *Jpn. J. Pharmacol.* **58**(Suppl. 1) 238P, 1992. KF19514 and KF17625 may be represented by

10 Formulas (0.0.41) and (0.0.42):

KF19514
(0.0.41)

KF17625

(0.0.42)

The reported potency and lack of emesis in a series of indandiones suggests that the hypothesis that has related side-effects such as emesis to the ratio of affinity for the PDE4 enzyme relative to that for the high affinity rolipram binding site (HARBS) is erroneous. Such indandiones may be represented by Formulas (0.0.43) and (0.0.44):

15

R = benzyloxy (0.0.43)

R = [1,4']-piperidiny-1'-carbonyloxy (0.0.44)

The PDE4 inhibitors that have been created heretofore fall into a significant number of different classes in terms of their chemical structures. Such classes have been as diverse as phenanthridines and naphthyridines. One class of PDE4 inhibitors are lignans such as T-440, which has been demonstrated to have activity in the inhibition of the following: early phase bronchoconstriction induced by antigen, histamine, LTD4, U-46619, Ach, neurokinin A, and endothelin-1; allergen-induced early phase and late phase bronchoconstriction and BAL eosinophilia; and ozone-induced AHR and airway epithelial injury. Optimization of the PDE4

20

- 16 -

Inhibitory potency of such compounds has led to the discovery of T-2585, one of the most potent PDE4 inhibitors described to date with an IC_{50} value of 0.13 nM against guinea-pig lung PDE4. T-440 and T-2585 may be represented by Formulas (0.0.45) and (0.0.46):

Another class of PDE4 inhibitors consists of benzofurans and benzothiophenes. In particular, furan and chroman rings have been utilized as surrogates for the cyclopentylether of the rolipram pharmacophore. An example of such a compound is one that is apparently related in structure to BAY 19-8004, and which may be represented by Formula (0.0.47):

Another benzofuran-type compound has been reported to have an IC_{50} value of 2.5 nM, and may be represented by Formula (0.0.48):

A compound with a related structure, which is not, however, a benzofuran, is characterized by a fused dioxicin ring and is reported to produce almost complete inhibition of canine tracheal PDE4 at 100 nM. This compound may be represented by Formula (0.0.49):

- 17 -

(0.0.49)

Quinolines and quinolones are a further class of PDE4 inhibitor structures, and they serve as surrogates for the catechol moiety of rolipram. This compound and two compounds of similar structure may be represented by Formulas (0.0.50), (0.0.51), and (0.0.52):

(0.0.50)

(0.0.51)

(0.0.52)

Purines, xanthines, and pteridines represent yet further classes of chemical compounds to which PDE4 inhibitors described heretofore in the art belong. The compound V-11294A described further above and represented by Formula (0.0.22), is a purine. A PDE4 inhibitor which is a xanthine compound, the class of compounds to which theophylline belongs, has been described in the art; Montana *et al.*, "PDE4 inhibitors, new xanthine analogues," *Bioorg. Med. Chem. Letts.* 8 2925-2930, 1998. The xanthine compound may be represented by Formula (0.0.54):

(0.0.54)

A potent PDE4 inhibitor belonging to the pteridine class of compounds has been demonstrated to have an IC_{50} value of 16 nM against a PDE4 derived from tumor cells and to inhibit the growth of tumor cells at micromolar concentrations; Merz *et al.*, "Synthesis of 7-

- 18 -

Benzylamino-6-chloro-2-piperazino-4-pyrrolidinopteridine and novel derivatives free of positional isomers. Potent inhibitors of cAMP-specific phosphodiesterase and of malignant tumor cell growth," *J. Med. Chem.* 41(24) 4733-4743, 1998. The pteridine PDE4 inhibitor may be represented by Formula (0.0.55):

5

(0.0.55)

Triazines represent a still further class of chemical compounds to which PDE4 inhibitors belong that have been described in the art heretofore. Two such triazines have been described which display bronchodilator activity and are potent relaxant agents in a guinea-pig trachea model. These compounds, which may be represented by Formulas (0.0.56) and (0.0.57) below, are also moderately potent PDE4 inhibitors with IC₅₀ values of 150 and 140 nM, respectively:

10

(0.0.56)

(0.0.57)

15 A triazine having a structure assumed to be closely related to that of the compounds of Formulas (0.0.56) and (0.0.57) is UCB-29936, which has been demonstrated to have activity in a murine model of septic shock; Danhaive *et al.*, "UCB29936, a selective phosphodiesterase Type IV inhibitor: therapeutic potential in endotoxic shock," *Am. J. Respir. Crit. Care. Med.* 159 A611, 1999.

20 Efforts have also been made in the art to improve the selectivity of PDE4 inhibitors with respect to the A through D subtypes described further above. There are presently four known isoforms (subtypes) of the PDE4 isozyme, encompassing seven splice variants, also described further above. The PDE4D isoform mRNA is expressed in inflammatory cells such as neutrophils and eosinophils, and it has been suggested in the art that D-selective inhibitors

25 of PDE4 will provide good clinical efficacy with reduced side-effects. A nicotinamide derivative displaying selectivity for inhibition of the PDE4D isoform has been described; WO 98/45268; as well as a naphthyridine derivative reported to be a PDE4D selective inhibitor;

WO 98/18796. These compounds may be represented by Formulas (0.0.58) and (0.0.59), respectively:

(0.0.58)

(0.0.59)

- 5 Another nicotinamide compound has been described in the art which may be useful in the treatment of CNS diseases such as multiple sclerosis; GB-2327675; and a rolipram derivative has been described in the art which is a PDE4 inhibitor which binds with equal affinity to both the catalytic and the HARB sites on human PDE4B2B; Tian *et al.*, "Dual inhibition of human Type 4 phosphodiesterase isozymes by (R,R)-(+/-)-methyl-3-acetyl-4-[3-
- 10 (cyclopentyloxy)-4-methoxyphenyl]-3-methyl-1-pyrrolidine carboxylate," *Biochemistry* 37(19) 6894-6904, 1998. The nicotinamide derivative and the rolipram derivative may be represented by Formulas (0.0.60) and (0.0.61), respectively:

(0.0.60)

(0.0.61)

- 15 Further background information concerning selective PDE4 isozymes may be found in publications available in the art, e.g., Norman, "PDE4 inhibitors 1999," *Exp. Opin. Ther. Patents* 9(8) 1101-1118, 1999 (Ashley Publications Ltd.); and Dyke and Montana, "The therapeutic potential of PDE4 inhibitors," *Exp. Opin. Invest. Drugs* 8(9) 1301-1325, 1999 (Ashley Publications Ltd.).

20 3.0 DESCRIPTION OF THE STATE OF THE ART

WO 98/45268 (Marfat *et al.*), published October 15, 1998, discloses nicotinamide derivatives having activity as selective inhibitors of PDE4D isozyme. These selective inhibitors are represented by Formula (0.1.1):

- 20 -

(0.1.1)

US 4,861,891 (Saccomano *et al.*), issued August 29, 1989, discloses nicotinamide compounds which function as calcium independent c-AMP phosphodiesterase inhibitors useful as antidepressants, of Formula (0.1.2):

(0.1.2)

The nicotinamide nucleus of a typical compound disclosed in this patent is bonded directly to the R¹ group, which is defined as 1-piperidyl, 1-(3-indolyl)ethyl, C₁-C₄ alkyl, phenyl, 1-(1-phenylethyl), or benzyl optionally mono-substituted by methyl, methoxy, chloro or fluoro. The R² substituent is bicyclo[2.2.1]hept-2-yl or

where Y is H, F or Cl; and X is H, F, Cl, OCH₃, CF₃, CN, COOH, -C(=O)(C₁-C₄) alkoxy, NH(CH₃)C(=O)- (methylcarbamoyl) or N(CH₃)₂C(=O)- (dimethylcarbamoyl).

US 4,692,185 (Michaely *et al.*) discloses herbicides such as those of Formula (0.1.3):

(0.1.3)

where R is (C₁-C₄) alkyl, (C₁-C₄) haloalkyl, or halo.

EP 550 900 (Jeschke *et al.*) discloses herbicides and plant nematocides of Formula (0.1.4):

- 21 -

(0.1.4)

where n is 0-3; R¹ is selected from numerous groups, but is usually H, 6-CH₃, or 5-Cl; R² is alkyl, alkenyl, alkynyl, cycloalkyl, aryl or aralkyl; R¹ and R² is halo, CN, NO₂, alkyl, haloalkyl, alkoxy, haloalkoxy, alkylthio, haloalkylthio, alkylsulfonyl, haloalkylsulfonyl, aryl, aryloxy, or arylthio; and R⁴ is alkyl.

EP 500 989 (Mollner *et al.*) discloses ACE inhibitors of Formula (0.1.5):

(0.1.5)

where n is 0-3; R is OH, SH, COOH, NH₂, halo, OR₄, SR₄, COOR₄, NHR₄ or N(R₄)₂, where R₄ is lower alkyl, optionally substituted aryl, or acyl; R₁ is OH, lower alkoxy, optionally substituted aryl lower alkoxy, aryloxy, or disubstituted amino; R₂ is lower alkyl or amino lower alkyl; and R¹ and R² is halo, NO₂, lower alkyl, halo lower alkyl, aryl lower alkyl, or aryl. Specific embodiments disclosed include compounds such as that of Formula (0.1.6):

(0.1.6)

FR 2.140.772 (Aries) discloses compounds asserted to have utility as analgesics, tranquilizers, antipyretics, anti-inflammatories, and antirheumatics, of Formula (0.1.7):

(0.1.7)

20

- 22 -

where R is 1 or 2 substituents chosen from lower alkyl, trihalomethyl, alkoxy, and halo; R' is H or alkyl; and R'' is hydrogen or alkyl.

JP 07 304775 (Otsuka *et al.*) discloses naphthyridine and pyridopyrazine derivatives which have anti-inflammatory, immunomodulating, analgesic, antipyretic, antiallergic, and antidepressive action. Also disclosed are intermediates of Formula (0.1.8):

(0.1.8)

where X may be CH, and R and R' are each lower alkyl.

With regard to the disclosures of the above-identified patents and published patent applications, it will be appreciated that only the disclosure of WO 98/45268 (Marfat *et al.*) concerns the inhibition of PDE4 isozymes. The state of the art also contains information regarding compounds wholly dissimilar in chemical structure to those of Formula (1.0.0) of the present invention, but which, on the other hand, possess biological activity similar to that of the compounds of Formula (1.0.0). Representative patents and published patent applications disclosing said information are illustrated further below.

US 5,552,438; US 5,602,157; and US 5,614,540 (all to Christensen), which all share the same April 2, 1992 priority date, relate to a therapeutic agent identified as ARIFLO®, which is a compound of Formula (0.1.9) and named as indicated below:

ARIFLO®
cis-[4-cyano-4-(3-cyclopentyl-oxy-4-methoxyphenyl)cyclo-hexane-1-carboxylic acid

(0.1.9)

The compound of Formula (0.1.9) falls within the scope of US 5,552,438 which discloses a genus of compounds of Formula (0.1.10):

(0.1.10)

where $R_1 = -(CR_4R_5)_rR_6$ where $r = 0$ and $R_6 = C_{3-8}$ cycloalkyl; $X = YR_2$ where $Y = O$ and $R_2 = -CH_3$; $X_2 = O$; $X_3 = H$; and $X_4 =$ a moiety of partial Formula (0.1.10.1)

- 23 -

(0.1.10.1)

where $X_5 = H$; $s = 0$; R_1 and $R_2 = CN$; and $Z = C(O)OR_{14}$ where $R_{14} = H$. The disclosures of US 5,602,157 and US 5,614,540 differ from that of US 5,552,438 and each other as to the definition of the R_3 group, which in the case of the ARIFLO® compound, is CN. A preferred salt form of the ARIFLO® compound is disclosed to be the tris(hydroxymethyl)ammonium methane salt.

US 5,863,926 (Christensen *et al.*) discloses analogs of the ARIFLO® compound, e.g., that of Formula (0.1.11):

10

(0.1.11)

WO 99/18793 (Webb *et al.*) discloses a process of making the ARIFLO® and related compounds. WO 95/00139 (Barnette *et al.*) claims a compound which has an IC_{50} ratio of about 0.1 or greater as regards the IC_{50} for the PDE IV catalytic form which binds rolipram with a high affinity, divided by the IC_{50} for the form which binds rolipram with a low affinity; but in a dependent claim restricts the scope thereof to a compound which was not known to be a PDE4 inhibitor prior to June 21, 1993.

15

WO 99/20625 (Eggleston) discloses crystalline polymorphic forms of cipamfylline for treatment of PDE₄ and TNF mediated diseases, of Formula (0.1.12):

20

Cipamfylline

(0.1.12)

WO 99/20280 (Griswold *et al.*) discloses a method of treating pruritis by administering an effective amount of a PDE4 inhibitor, e.g., a compound of Formula (0.1.13):

- 24 -

(0.1.13)

US 5,922,557 (Pon) discloses a CHO-K1 cell line which stably expresses high levels of a full length low-Km cAMP specific PDE4A enzyme, which has, in turn, been used to examine potent PDE4 enzyme inhibitors and compare the rank order of their potencies in elevating cAMP in a whole-cell preparation with their ability to inhibit phosphodiesterase activity in a broken-cell preparation. It is further said to be found that the soluble enzyme inhibition assay described in the prior art does not reflect behavior of the inhibitors acting *in vivo*. An improved soluble enzyme whole-cell assay is then disclosed which is said to reflect the behavior of inhibitors acting *in vivo*. It is further disclosed that there exist at least four distinct PDE4 isoforms or subtypes, and that each subtype has been shown to give rise to a number of splice variants, which in themselves can exhibit different cellular localization and affinities for inhibitors.

With regard to the disclosures of the above-identified patents and published patent applications, it will be appreciated that the compounds involved possess the same biological activity as the compounds of Formula (1.0.0). At the same time, however, the artisan will observe that the chemical structures of said compounds disclosed in the prior art are not only diverse from each other but dissimilar to that of the novel compounds of the present invention as well. The state of the art contains still further information regarding compounds which are dissimilar in chemical structure to those of Formula (1.0.0), and which, moreover, do not possess PDE4 inhibitory activity similar to that of the compounds of Formula (1.0.0). Such compounds disclosed in the prior art do, nevertheless, often have therapeutic utility similar to that possessed by the compounds of Formula (1.0.0), *i.e.*, in the treatment of inflammatory, respiratory and allergic diseases and conditions. In particular this is applicable to certain inhibitors of enzymes and antagonists of receptors in the so-called leukotriene pathway. This is especially the case with regard to the leukotrienes LTB₄ and LTD₄. Accordingly, representative patents and published patent applications disclosing further information of this type are described below.

Arachidonic acid is metabolized by cyclooxygenase-1 and by 5-lipoxygenase. The 5-lipoxygenase pathway leads to the production of leukotrienes (LTs) which contribute to the inflammatory response through their effect on neutrophil aggregation, degranulation and chemotaxis; vascular permeability; smooth muscle contractility; and on lymphocytes. The

- 25 -

cysteinyl leukotrienes, LTC₄, LTD₄, and LTE₄, play an important role in the pathogenesis of asthma. The components of the leukotriene pathway which afford targets for therapeutic intervention are illustrated in the following diagram:

- 5 Accordingly, agents which are able to intervene in any of the steps of the 5-lipoxygenase pathway afford an opportunity for therapeutic treatment. An example of one such agent is the 5-lipoxygenase inhibitor, zileuton, a therapeutic agent identified as ZYFLO® which may be represented by Formula (0.1.14):

ZYFLO®

Zileuton

(0.1.14)

Another such agent is the LTD₄ receptor antagonist zafirlukast, a therapeutic agent identified as ACCOLATE® which may be represented by Formula (0.1.15):

- 26 -

ACCOLATE®

Zafirlukast

(0.1.15)

A further such LTD₄ receptor antagonist is montelukast, a therapeutic agent identified
5 as SINGULAIR® which may be represented by Formula (0.1.16):

SINGULAIR®

Montelukast

(0.1.16)

Another type of the above-mentioned therapeutic targets is the LTB₄ receptor, and an
10 example of an antagonist for said receptor is BIIL-260, a therapeutic agent which may be
represented by Formula (0.1.17):

BIIL-260

(0.1.17)

Another example of a therapeutic agent which is an LTB₄ receptor antagonist is CGS-
15 25019c which may be represented by Formula (0.1.18):

(0.1.18)

Nothing in the above-described state of the art discloses or would suggest to the artisan the novel compounds of the present invention or their PDE4 inhibitory activity and the resulting significant improvement in therapeutic utility and therapeutic index in the treatment of inflammatory, respiratory and allergic diseases and conditions.

4.0 SUMMARY OF THE INVENTION

The present invention is concerned with novel compounds which have biological activity as inhibitors of the phosphodiesterase so-called "Type IV" isoenzyme ("PDE4 isozyme"). Embodiments of the novel compounds of the present invention are active as non-selective inhibitors of the PDE4 isozyme. Other embodiments of said novel compounds have PDE4 isozyme substrate specificity, especially for the D subtype. Said novel compounds having non-selective or D-selective PDE4 inhibitor activity are generally useful in the therapeutic treatment of various inflammatory, allergic, and respiratory diseases and conditions, and they afford in particular a significant improvement in the therapeutic treatment of obstructive respiratory diseases, especially asthma and chronic obstructive pulmonary disease (COPD).

The present invention relates to a compound of Formula (1.0.0):

(1.0.0)

— wherein —

- j is 0 or 1; provided that when j is 0, n must be 2;
-k is 0 or 1
-m is 1, 2, or 3;
25 -n is 1 or 2;

- 28 -

$-W^1$ and W^2 are independently $-O-$; $-S(=O)_t-$, where t is 0, 1, or 2; or $-N(R^3)-$ where R^3 has the same meaning as defined below;

$-Y$ is $=C(R^1_a)-$, where R^1_a has the same meaning as defined below; or $-[N\Rightarrow(O)_k]-$ where k is 0 or 1;

5

— where —

$-R^1_a$ is a member selected from the group consisting of $-H$; $-F$; $-Cl$; $-CN$; $-NO_2$; $-(C_1-C_4)$ alkyl; $-(C_2-C_4)$ alkynyl; fluorinated- (C_1-C_3) alkyl; fluorinated- (C_1-C_3) alkoxy; $-OR^{16}$; and $-C(=O)NR^{22}_aR^{22}_b$;

— where —

10 $-R^{22}_a$ and R^{22}_b are each independently $-H$; $-CH_3$; $-CH_2CH_3$; $-CH_2CH_2CH_3$; $-CH_2(CH_3)_2$; $-CH_2CH_2CH_2CH_3$; $-CH(CH_3)CH_2CH_3$; $-CH_2CH(CH_3)_2$; $-C(CH_3)_3$; cyclopropyl; cyclobutyl; or cyclopentyl;

$-R^A$ and R^B are each a member independently selected from the group consisting of $-H$; $-F$; $-CF_3$; $-(C_1-C_4)$ alkyl; $-(C_3-C_7)$ cycloalkyl; phenyl; and benzyl; wherein said
15 cycloalkyl, phenyl, and benzyl moieties are each independently substituted with 0 to 3 substituents R^{10} ;

— where —

$-R^{10}$ is a member selected from the group consisting of phenyl; pyridyl; $-F$; $-Cl$; $-CF_3$; oxo ($=O$); $-OR^{16}$; $-NO_2$; $-CN$; $-C(=O)OR^{16}$; $-O-C(=O)R^{16}$; $-C(=O)NR^{16}R^{17}$;
20 $-O-C(=O)NR^{16}R^{17}$; $-NR^{16}R^{17}$; $-NR^{16}C(=O)R^{17}$; $-NR^{16}C(=O)OR^{17}$; $-NR^{16}S(=O)_2R^{17}$; and $-S(=O)_2NR^{16}R^{17}$; where said phenyl or pyridyl is substituted by 0 to 3 R^{11} ;

— where —

$-R^{11}$ is $-F$; $-Cl$; $-CF_3$; $-CN$; $-NO_2$; $-OH$; $-(C_1-C_3)$ alkoxy; $-(C_1-C_3)$ alkyl; or
25 $-NR^{16}R^{17}$;

25

— and —

$-R^{16}$ and R^{17} are each a member independently selected from the group consisting of $-H$; $-(C_1-C_4)$ alkyl; $-(C_2-C_4)$ alkenyl; $-(C_3-C_6)$ cycloalkyl; phenyl; benzyl; and pyridyl; wherein said alkyl, alkenyl, cycloalkyl, phenyl, benzyl, or pyridyl is substituted by 0 to 3 substituents selected from the group consisting of $-F$, $-Cl$, $-CF_3$, $-CN$, and $-(C_1-C_3)$ alkyl;

- 29 -

— or —

$-R^A$ and R^B are taken together, but only in the case where m is 1, to form a spiro moiety of Formula (1.2.0):

5

(1.2.0)

— where —

$-r$ and s are independently 0 to 4 provided that the sum of $r + s$ is at least 1 but not greater than 5;

— and —

- 10 $-X^A$ is selected from $-CH_2-$, $-CH(R^{11})-$, or $C(R^{11})_2-$, where each R^{11} is selected independently of the other and each has the same meaning as defined above; $-NR^{15}-$, where R^{15} has the same meaning as defined below; $-O-$; and $-S(=O)_t-$, where t is 0, 1, or 2;

— and —

- 15 said spiro moiety of partial Formula (1.2.0) is substituted as to any one or more carbon atoms thereof, other than that defining X^A , by 0 to 3 substituents R^{14} , where R^{14} has the same meaning as defined below; as to a nitrogen atom thereof by 0 or 1 substituent R^{15} , where R^{15} has the same meaning as defined below; and as to a sulfur atom thereof by 0 or 2 oxygen atoms;

- 20 $-R^C$ and R^D have the same meaning as defined above for R^A and R^B except that one of them must be $-H$, and they are selected independently of each other and of R^A and R^B ;

- $-R^1$ and R^2 may individually or together appear on any ring or rings comprising a meaning of the moiety J^2 as defined below; and R^1 and R^2 are each a member independently selected from the group consisting of $-H$; $-F$; $-Cl$; $-CN$; $-NO_2$; $-(C_1-C_4)$ alkyl; $-(C_2-C_4)$ alkynyl; fluorinated- $-(C_1-C_3)$ alkyl; $-OR^{16}$; and $-C(=O)NR^{22}_aR^{22}_b$; where R^{16} , R^{22}_a , and R^{22}_b have the same meanings as defined above;

$-R^3$ is $-H$; $-(C_1-C_3)$ alkyl; phenyl; benzyl; or $-OR^{16}$, where R^{16} has the same meaning as defined above;

- 30 -

$-R^4$, R^5 and R^6 may individually or together appear on any ring or rings comprising a meaning of the moiety J^1 as defined below; and R^4 , R^5 and R^6 are each a member independently selected from the group consisting of

— the following: —

- 5 -(a) -H; -F; -Cl; $-(C_2-C_4)$ alkynyl; $-R^{16}$; $-OR^{16}$; $-S(=O)_pR^{16}$; $-C(=O)R^{16}$; $-C(=O)OR^{16}$; $-OC(=O)R^{16}$; -CN; $-NO_2$; $-C(=O)NR^{16}R^{17}$; $-OC(=O)NR^{16}R^{17}$; $-NR^{22}_aC(=O)NR^{16}R^{17}$; $-NR^{22}_aC(=NR^{12})NR^{16}R^{17}$; $-NR^{22}_aC(=NCN)NR^{16}R^{17}$; $-NR^{22}_aC(=N-NO_2)NR^{16}R^{17}$; $-C(=NR^{22}_a)NR^{16}R^{17}$; $-CH_2C(=NR^{22}_a)NR^{16}R^{17}$; $-OC(=NR^{22}_a)NR^{16}R^{17}$; $-OC(=N-NO_2)NR^{16}R^{17}$; $-NR^{16}R^{17}$; $-CH_2NR^{16}R^{17}$; $-NR^{22}_aC(=O)R^{16}$;
10 $-NR^{22}_aC(=O)OR^{16}$; $=NOR^{16}$; $-NR^{22}_aS(=O)_pR^{17}$; $-S(=O)_pNR^{16}R^{17}$; and $-CH_2C(=NR^{22}_a)NR^{16}R^{17}$;

— where —

$-p$ is 0, 1, or 2; and R^{22}_a , R^{16} , and R^{17} have the same meanings as defined above;

- 15 -(b) $-(C_1-C_4)$ alkyl; and $-(C_1-C_4)$ alkoxy in the case where one or more of R^4 , R^5 , or R^6 has the meaning of $-OR^{16}$ under (a) above and R^{16} is defined as $-(C_1-C_4)$ alkyl; wherein said alkyl and alkoxy are each independently substituted with 0 to 3 substituents -F or -Cl; or 0 or 1 substituent (C_1-C_2) alkoxy carbonyl-; (C_1-C_2) alkyl carbonyl-; or (C_1-C_2) alkyl carbonyloxy-;

— and —

- 20 -(c) an aryl or heterocyclyl moiety selected from the group consisting of phenyl; benzyl; furanyl; tetrahydrofuranyl; oxetan-yl; thienyl; tetrahydrothienyl; pyrrolyl; pyrrolidinyl; oxazolyl; oxazolidinyl; isoxazolyl; isoxazolidinyl; thiazolyl; thiazolidinyl; isothiazolyl; isothiazolidinyl; pyrazolyl; pyrazolidinyl; oxadiazolyl; thiadiazolyl; imidazolyl; imidazolidinyl; pyridinyl; pyrazinyl; pyrimidinyl; pyridazinyl; piperidinyl; piperazinyl; triazolyl; triazinyl;
25 tetrazolyl; pyran-yl; azetid-yl; morpholin-yl, parathiazin-yl; indol-yl; indolin-yl; benzo[b]furanyl; 2,3-dihydrobenzofuranyl; 2-*H*-chromen-yl; chroman-yl; benzothien-yl; 1-*H*-indazol-yl; benzimidazol-yl; benzoxazol-yl; benzisoxazol-yl; benzthiazol-yl; quinolin-yl; isoquinolin-yl; phthalazin-yl; quinazolin-yl; quinoxalin-yl; and purin-yl; wherein said aryl and heterocyclyl moieties are each independently substituted with 0 to 2 substituents R^{14}

- 30 — where —

$-R^{14}$ is a member selected from the group consisting of $-(C_1-C_4)$ alkyl; $-(C_3-C_7)$ cycloalkyl; phenyl; benzyl; pyrid-yl; and quinolin-yl; where said alkyl, cycloalkyl, phenyl, benzyl, pyrid-yl, or quinolin-yl is substituted by 0, 1, or 2 substituents -F, -Cl, $-CH_3$,

- 31 -

-OR¹⁶, -NO₂, -CN, or -NR¹⁶R¹⁷; and said R¹⁴ group further consists of -F; -Cl; -CF₃; oxo (=O); -OR¹⁶; -NO₂; -CN; -C(=O)OR¹⁶; -O-C(=O)R¹⁶; -C(=O)NR¹⁶R¹⁷; -O-C(=O)NR¹⁶R¹⁷; -NR¹⁶R¹⁷; -NR¹⁶C(=O)R¹⁷; -NR¹⁶C(=O)OR¹⁷; -NR¹⁶S(=O)₂R¹⁷; or -S(=O)₂NR¹⁶R¹⁷; where R¹⁶ and R¹⁷ have the same meanings as defined above;

5

— and further where —

—R¹⁵ is a member independently selected from the group consisting of -H; -NR¹⁶R¹⁷; -C(=O)R¹⁶; -OR¹⁶; -(C₁-C₄) alkyl-OR¹⁶; -C(=O)OR¹⁶; -(C₁-C₂) alkyl-C(=O)OR¹⁶; -C(=O)NR¹⁶R¹⁷; -(C₁-C₄) alkyl; -(C₂-C₄) alkenyl; -(CH₂)_u-(C₃-C₇) cycloalkyl where u is 0, 1 or 2; phenyl; benzyl; pyridyl; and quinoliny; wherein said alkyl, alkenyl, alkoxy, cycloalkyl, phenyl, benzyl, pyridyl or quinoliny is substituted with 0 to 3 substituents R¹², where R¹⁶ and R¹⁷ have the same meanings as defined above; and

10

— where —

—R¹² is a member independently selected from the group consisting of -F; -Cl; -CO₂R¹⁸; -OR¹⁶; -CN; -C(=O)NR¹⁸R¹⁹; -NR¹⁸R¹⁹; -NR¹⁸C(=O)R¹⁹; -NR¹⁸C(=O)OR¹⁹; -NR¹⁸S(=O)_pR¹⁹; -S(=O)_pNR¹⁸R¹⁹, where p is 1 or 2; -(C₁-C₄) alkyl; and -(C₁-C₄) alkoxy in the case where R¹² has the meaning of -OR¹⁶ above and R¹⁶ is defined as -(C₁-C₄) alkyl; wherein said alkyl and alkoxy are each independently substituted with 0 to 3 substituents independently selected from -F; -Cl; -(C₁-C₂) alkoxycarbonyl; -(C₁-C₂) alkylcarbonyl; and -(C₁-C₂) alkylcarbonyloxy; where R¹⁶ has the same meaning as defined above; and

20

— where —

—R¹⁸ and R¹⁹ are independently selected from the group consisting of -H; -(C₁-C₄) alkyl; and phenyl; where said alkyl or phenyl is substituted by 0-3 of -F; or -Cl;

— or in the case where J¹ is phenyl —

-(d) R⁵ and R⁶ are taken together to form a moiety which is a member selected from the group consisting of partial Formulas (1.3.1) through (1.3.15):

25

- 32 -

5

— wherein —

—R²⁰ and R²¹ are each a member independently selected from the group consisting of —H; —F; —Cl; —CH₃; —CH₂F; —CHF₂; —CF₃; —OCH₃; and —OCF₃;

—R²³ and R²⁴ are each independently —H; —CH₃; —OCH₃; —CH₂CH₃; —OCH₂CH₃; —CH₂CH₂CH₃; —CH₂(CH₃)₂; —CH₂CH₂CH₂CH₃; —CH(CH₃)CH₂CH₃; —CH₂CH(CH₃)₂; —C(CH₃)₃;

10 or absent, in which case the dashed line — — — — represents a double bond;

—J¹ is a moiety comprising a saturated or unsaturated carbon ring system that is a 3- to 7-membered monocyclic, or that is a 7- to 12-membered, fused polycyclic; provided that J¹ is not a discontinuous or restricted biaryl moiety; and wherein optionally one carbon atom of said carbon ring system may be replaced by a heteroatom selected from N, O, and S; where optionally a second carbon atom thereof, and further optionally a third carbon atom thereof may be replaced by N;

15

— wherein —

said moiety defining J¹ is substituted on any ring or rings thereof by R⁴, R⁵ and R⁶, which have the same meaning as defined above;

20 —J² is a moiety comprising a saturated or unsaturated carbon ring system that is a 3- to 7-membered monocyclic, or that is a 7- to 12-membered, fused polycyclic; provided that J² is not a discontinuous or restricted biaryl moiety; and wherein optionally one carbon atom of said carbon ring system may be replaced by a heteroatom selected from N, O, and S; where optionally a second carbon atom thereof, and further optionally a third carbon atom thereof may be replaced by N;

25

— wherein —

- 33 -

said moiety defining J^2 is substituted on any ring or rings thereof by R^1 and R^2 , which have the same meaning as defined above;

-D is a member independently selected from the group consisting of

— the following —

5 **-(a)** the group consisting of partial Formulas (1.1.1) through (1.1.9):

(1.1.1)

(1.1.2)

(1.1.3)

(1.1.4)

(1.1.5)

(1.1.6)

(1.1.7)

(1.1.8)

(1.1.9)

10

— wherein —

--"*" indicates the point of attachment of each partial Formula (1.1.1) through (1.1.9) to the remaining portion of Formula (1.0.0);

--q is 1, 2, or 3, provided that where q is 2 or 3, R^9 has the meaning of $-H$ in at least one instance, or two instances, respectively;

15 --v 0 or 1;

-- W^3 is $-O-$; $-N(R^9)-$, where R^9 has the same meaning as defined below; or $-OC(=O)-$;

-- R^7 is a member independently selected from the group consisting of

— the following: —

20 --(1) $-H$;

--(2) $-(C_1-C_6)$ alkyl; $-(C_2-C_6)$ alkenyl; or $-(C_2-C_6)$ alkynyl; where said alkyl, alkenyl or alkynyl is substituted by 0 to 3 substituents R^{10} , where R^{10} has the same meaning as defined above;

- 34 -

—(3) —(CH₂)_u-(C₃-C₇) cycloalkyl where u is 0, 1 or 2; and further where said (C₃-C₇) cycloalkyl is substituted by 0 to 3 substituents R¹⁰ where R¹⁰ has the same meaning as defined above;

— and —

5 —(4) phenyl or benzyl, where said phenyl or benzyl is independently substituted by 0 to 3 substituents R¹⁰ where R¹⁰ has the same meaning as defined above;

—R⁸ is a member independently selected from the group consisting of

— the following: —

10 —(1) phenyl; tetrazol-5-yl; 1,2,4-triazol-3-yl; 1,2,4-triazol-3-on-5-yl; 1,2,3-triazol-5-yl; imidazol-2-yl; imidazol-4-yl; imidazolidin-2-on-4-yl; 1,3,4-oxadiazolyl; 1,3,4-oxadiazol-2-on-5-yl; 1,2,4-oxadiazol-3-yl; 1,2,4-oxadiazol-5-on-3-yl; 1,2,4-oxadiazol-5-yl; 1,2,4-oxadiazol-3-on-5-yl; 1,2,5-thiadiazolyl; 1,3,4-thiadiazolyl; morpholinyl; parathiazinyl; oxazolyl; isoxazolyl; thiazolyl; isothiazolyl; pyrrolyl; pyrazolyl; succinimidyl; glutarimidyl; pyrrolidonyl; 2-piperidonyl; 2-pyridonyl; 4-pyridonyl; pyridazin-3-onyl; pyridyl; pyrimidinyl; 15 pyrazinyl; pyridazinyl;

— and —

20 —(2) indolyl; indoliny; isoindoliny; benzo[b]furanyl; 2,3-dihydrobenzofuranyl; 1,3-dihydroisobenzofuranyl; 2*H*-1-benzopyranyl; 2-*H*-chromenyl; chromanyl; benzothienyl; 1*H*-indazolyl; benzimidazolyl; benzoxazolyl; benzisoxazolyl; benzothiazolyl; benzotriazolyl; benzotriazinyl; phthalazinyl; 1,8-naphthyridinyl; quinoliny; isoquinoliny; quinazoliny; quinoxaliny; pyrazolo[3,4-*d*]pyrimidinyl; pyrimido[4,5-*d*]pyrimidinyl; imidazo[1,2-*a*]pyridinyl; pyridopyridinyl; pteridinyl; and 1*H*-purinyl;

— where —

25 any moiety recited in (1) or (2) above is optionally substituted with respect to (i) any one or more carbon atoms thereof optionally by a substituent R¹⁴ where R¹⁴ has the same meaning as defined above; (ii) any one or more nitrogen atoms thereof that is not a point of attachment of said moiety, optionally by a substituent R¹⁵ where R¹⁵ has the same meaning as defined above, and all tautomer forms thereof; and (iii) any sulfur atom thereof that is not a point of attachment of said moiety, by 0, 1, or 2 oxygen atoms;

30 —R⁹ is a member selected from the group consisting of —H; —(C₁-C₄) alkyl; —(C₃-C₇) cycloalkyl; phenyl; benzyl; pyridyl; —C(=O)OR¹⁶; —C(=O)R¹⁶; —OR¹⁶; —(C₁-C₂) alkyl—OR¹⁶; and —(C₁-C₂) alkyl—C(=O)OR¹⁶; where R¹⁶ has the same meaning as defined above;

— and D is further selected from —

- 35 -

- 5 (b) a moiety comprising a member selected from the group consisting of
 $-O-P(=O)(OH)_2$ (phosphoric); $-PH(=O)OH$ (phosphinic); $-P(=O)(OH)_2$ (phosphonic);
 $-[P(=O)(OH)-O(C_1-C_4) \text{ alkyl}]$ (alkylphosphono); $-P(=O)(OH)-O(C_1-C_4) \text{ alkyl}$
(alkylphosphinyl); $-P(=O)(OH)NH_2$ (phosphoramido); $-P(=O)(OH)NH(C_1-C_4) \text{ alkyl}$ and
10 $-P(=O)(OH)NHR^{25}$ (substituted phosphoramido); $-O-S(=O)_2OH$ (sulfuric); $-S(=O)_2OH$
(sulfonic); $-S(=O)_2NHR^{26}$ or $-NHS(=O)_2R^{26}$ (sulfonamido) where R^{26} is $-CH_3$, $-CF_3$, or *o*-
toluyl; and acylsulfonamido selected from the group consisting of $-C(=O)NHS(=O)_2R^{25}$;
 $-C(=O)NHS(=O)_2NH_2$; $-C(=O)NHS(=O)_2(C_1-C_4) \text{ alkyl}$; $-C(=O)NHS(=O)_2NH(C_1-C_4) \text{ alkyl}$;
15 $-C(=O)NHS(=O)_2N[(C_1-C_4) \text{ alkyl}]_2$; $-S(=O)_2NHC(=O)(C_1-C_4) \text{ alkyl}$; $-S(=O)_2NHC(=O)NH_2$;
 $-S(=O)_2NHC(=O)NH(C_1-C_4) \text{ alkyl}$; $-S(=O)_2NHC(=O)N[(C_1-C_4) \text{ alkyl}]_2$; $-S(=O)_2NHC(=O)R^{25}$;
 $-S(=O)_2NHCN$; $-S(=O)_2NHC(=S)NH_2$; $-S(=O)_2NHC(=S)NH(C_1-C_4) \text{ alkyl}$;
 $-S(=O)_2NHC(=S)N[(C_1-C_4) \text{ alkyl}]_2$; and $-S(=O)_2NHS(=O)_2R^{25}$;

— where —

- 15 $-R^{25}$ is $-H$; $-(C_1-C_4) \text{ alkyl}$; phenyl; or $-OR^{18}$, where R^{18} has the same meaning as
defined above;

— or —

a pharmaceutically acceptable salt thereof.

- 20 The present invention is concerned in particular with a compound of Formula (1.0.0)
as above-recited wherein the moiety **D** comprises as a preferred meaning of R^7 , phenyl,
benzyl, or cyclohexyl illustrated in partial Formulas (1.1.45) through (1.1.47) below; or the
moiety **D** comprises R^8 of partial Formula (1.1.4) where *v* is 0 or 1, comprising a member
selected from the group consisting of partial Formulas (1.1.11) through (1.1.44) illustrated
below:

tetrazol-5-yl
(1.1.11)1,2,4-triazol-3-yl
(1.1.12)1,2,4-triazol-3-on-5-yl
(1.1.13)1,2,3-triazol-5-yl
(1.1.14)imidazol-2-yl
(1.1.15)imidazol-4-yl
(1.1.16)imidazolidin-2-on-4-yl
(1.1.17)1,3,4-oxadiazolyl

cyclohexyl
(1.1.47)

wherein "*" indicates the point of attachment of each partial Formula (1.1.11) through (1.1.47) to the remaining portion of Formula (1.0.0); and wherein each carbon atom of partial Formulas (1.1.11) through (1.1.44) is optionally substituted by a substituent R^{14} ; where R^{14} and R^{15} have the same meaning as defined above; and all tautomer forms, and optionally N-oxide forms, thereof; and further wherein each carbon atom of partial Formulas (1.1.45) through (1.1.47) is optionally substituted by a substituent R^{10} ; where R^{10} has the same meaning as defined above.

The present invention is further concerned more particularly with a compound of Formula (1.0.0) as above-recited wherein the moiety D is especially the below-indicated member selected from the above-recited group consisting of partial Formulas (1.1.11) through (1.1.47):

tetrazol-5-yl
(1.1.11)

1,2,4-triazol-3-yl
(1.1.12)

1,2,4-triazol-3-on-5-yl
(1.1.13)

1,2,3-triazol-5-yl
(1.1.14)

imidazol-2-yl
(1.1.15)

imidazol-4-yl
(1.1.16)

imidazolidin-2-on-4-yl
(1.1.17)

1,3,4-oxadiazol-2-on-5-yl
(1.1.19)

1,2,4-oxadiazol-
5-on-3-yl
(1.1.21)

1,2,4-oxadiazol-
3-on-5-yl
(1.1.23)

pyrazolyl
(1.1.33)

succinimidyl
(1.1.34)

glutarimidyl
(1.1.35)

2-pyridonyl
(1.1.38)

4-pyridonyl
(1.1.39)

pyridazin-3-onyl
(1.1.40)

pyridyl
(1.1.41)

pyrimidinyl
(1.1.42)

phenyl
(1.1.45)

cyclohexyl
(1.1.47)

The present invention is further concerned in particular with a compound of Formula (1.0.0) as above-recited wherein the moiety **D** comprises R^8 of partial Formula (1.1.4) where v is 0 or 1, and R^8 of said partial Formula (1.1.4) is a member selected from the group consisting of partial Formulas (1.4.1) through (1.4.28):

indolyl
(1.4.1)

indolinyl
(1.4.2)

isoindolyl
(1.4.3)

benzo[b]furanyl
(1.4.4)

2,3-dihydrobenzo-
furanyl
(1.4.5)

1,3-dihydroisobenzo-
furanyl; phthalanyl
(1.4.6)

2H-1-benzopyranyl
(1.4.7)

pyrimidinyl
(1.4.23)

pyrimido[5,4-d]-
pyrimidinyl
(1.4.24)

imidazo-[1,2-a]-
pyridinyl
(1.4.25)

pyridopyridinyl
(1.4.26)

pteridinyl
(1.4.27)

1H-purinyl
(1.4.28)

where "*" indicates the point of attachment to the remaining portion of Formula (1.0.0); and where each carbon atom is optionally substituted by a substituent R^{14} ; and where R^{14} and R^{15} have the same meaning as defined above; and all tautomer forms, and optionally N-oxide forms, thereof.

- 5 The present invention is further concerned with a compound of Formula (1.0.0) wherein J^1 comprises especially a member selected from the group consisting of phenyl; pyrrolyl; pyrrolidinyl; furanyl; thienyl; pyridyl; pyrimidinyl; piperidinyl; piperazinyl; imidazolyl;

- 40 -

- imidazolidinyl; oxazolyl; isoxazolyl; morpholinyl; thiazolyl; indolyl; quinolyl; isoquinolyl; benzimidazolyl; benzoxazolyl; quinuclidinyl; and azabicyclo[3.3.0]octanyl; a monocyclic $-(C_3-C_7)$ cycloalkyl moiety; a monocyclic $-(C_5-C_7)$ cycloalkenyl moiety that is a member selected from the group consisting of cyclopentenyl, cyclohexenyl, and cycloheptenyl; and a
- 5 bicyclic $-(C_7-C_{10})$ cycloalkyl or $-(C_7-C_{10})$ cycloalkenyl moiety that is a member selected from the group consisting of norbornanyl, norbornenyl, bicyclo[2.2.2]octanyl, bicyclo[3.2.1]octanyl, bicyclo[3.3.0]octanyl, bicyclo[2.2.2]oct-5-enyl, bicyclo[2.2.2]oct-7-enyl, bicyclo[3.3.1]nonanyl, cyclodecanyl, and adamantanyl.

- The present invention is still further concerned especially with a compound of
- 10 Formula (1.0.0) wherein particularly J^1 and the substituents R^4 , R^5 , and R^6 are selected in such a way that the left-hand terminus of said compound of Formula (1.0.0) is represented by the following partial Formulas (2.0.1) through (2.0.72):

5 The present invention is further concerned with a method of treating a subject suffering from a disease or condition mediated by the PDE4 isozyme in its role of regulating the activation and degranulation of human eosinophils, comprising administering to said subject in need of said treatment a therapeutically effective amount of a compound of Formula (1.0.0) as described above. Similarly, the present invention is also concerned with a pharmaceutical composition for use in such a therapeutic treatment, comprising a compound
10 of Formula (1.0.0) as described above together with a pharmaceutically acceptable carrier.

The present invention relates to PDE4 isozyme inhibitors comprising a compound of Formula (1.0.0) as described above which is useful in treating or preventing one or members selected from the groups of diseases, disorders, and conditions consisting of:

– asthma of whatever type, etiology, or pathogenesis; or asthma that is a member
15 selected from the group consisting of atopic asthma; non-atopic asthma; allergic asthma; atopic, bronchial, IgE-mediated asthma; bronchial asthma; essential asthma; true asthma; intrinsic asthma caused by pathophysiologic disturbances; extrinsic asthma caused by environmental factors; essential asthma of unknown or inapparent cause; non-atopic asthma; bronchitic asthma; emphysematous asthma; exercise-induced asthma; occupational asthma;
20 infective asthma caused by bacterial, fungal, protozoal, or viral infection; non-allergic asthma; incipient asthma; wheezy infant syndrome;

– chronic or acute bronchoconstriction; chronic bronchitis; small airways obstruction; and emphysema;

– obstructive or inflammatory airways diseases of whatever type, etiology, or
25 pathogenesis; or an obstructive or inflammatory airways disease that is a member selected from the group consisting of asthma; pneumoconiosis; chronic eosinophilic pneumonia; chronic obstructive pulmonary disease (COPD); COPD that includes chronic bronchitis, pulmonary emphysema or dyspnea associated therewith; COPD that is characterized by irreversible, progressive airways obstruction; adult respiratory distress syndrome (ARDS), and
30 exacerbation of airways hyper-reactivity consequent to other drug therapy;

– pneumoconiosis of whatever type, etiology, or pathogenesis; or pneumoconiosis that is a member selected from the group consisting of aluminosis or bauxite workers' disease; anthracosis or miners' asthma; asbestosis or steam-fitters' asthma; chalcosis or flint disease; ptilosis caused by inhaling the dust from ostrich feathers; siderosis caused by the

- 50 -

inhalation of iron particles; silicosis or grinders' disease; byssinosis or cotton-dust asthma; and talc pneumoconiosis;

5 – bronchitis of whatever type, etiology, or pathogenesis; or bronchitis that is a member selected from the group consisting of acute bronchitis; acute laryngotracheal bronchitis; arachidic bronchitis; catarrhal bronchitis; croupus bronchitis; dry bronchitis; infectious asthmatic bronchitis; productive bronchitis; staphylococcus or streptococcal bronchitis; and vesicular bronchitis;

10 – bronchiectasis of whatever type, etiology, or pathogenesis; or bronchiectasis that is a member selected from the group consisting of cylindric bronchiectasis; sacculated bronchiectasis; fusiform bronchiectasis; capillary bronchiectasis; cystic bronchiectasis; dry bronchiectasis; and follicular bronchiectasis;

15 – seasonal allergic rhinitis; or perennial allergic rhinitis; or sinusitis of whatever type, etiology, or pathogenesis; or sinusitis that is a member selected from the group consisting of purulent or nonpurulent sinusitis; acute or chronic sinusitis; and ethmoid, frontal, maxillary, or sphenoid sinusitis;

 – rheumatoid arthritis of whatever type, etiology, or pathogenesis; or rheumatoid arthritis that is a member selected from the group consisting of acute arthritis; acute gouty arthritis; chronic inflammatory arthritis; degenerative arthritis; infectious arthritis; Lyme arthritis; proliferative arthritis; psoriatic arthritis; and vertebral arthritis;

20 – gout, and fever and pain associated with inflammation;

 – an eosinophil-related disorder of whatever type, etiology, or pathogenesis; or an eosinophil-related disorder that is a member selected from the group consisting of eosinophilia; pulmonary infiltration eosinophilia; Löffler's syndrome; chronic eosinophilic pneumonia; tropical pulmonary eosinophilia; bronchopneumonic aspergillosis; aspergilloma; 25 granulomas containing eosinophils; allergic granulomatous angiitis or Churg-Strauss syndrome; polyarteritis nodosa (PAN); and systemic necrotizing vasculitis;

 – atopic dermatitis; or allergic dermatitis; or allergic or atopic eczema;

30 – urticaria of whatever type, etiology, or pathogenesis; or urticaria that is a member selected from the group consisting of immune-mediated urticaria; complement-mediated urticaria; urticariogenic material-induced urticaria; physical agent-induced urticaria; stress-induced urticaria; idiopathic urticaria; acute urticaria; chronic urticaria; angioedema; cholinergic urticaria; cold urticaria in the autosomal dominant form or in the acquired form; contact urticaria; giant urticaria; and papular urticaria;

- conjunctivitis of whatever type, etiology, or pathogenesis; or conjunctivitis that is a member selected from the group consisting of actinic conjunctivitis; acute catarrhal conjunctivitis; acute contagious conjunctivitis; allergic conjunctivitis; atopic conjunctivitis; chronic catarrhal conjunctivitis; purulent conjunctivitis; and vernal conjunctivitis
- 5 –uveitis of whatever type, etiology, or pathogenesis; or uveitis that is a member selected from the group consisting of inflammation of all or part of the uvea; anterior uveitis; iritis; cyclitis; iridocyclitis; granulomatous uveitis; nongranulomatous uveitis; phacoantigenic uveitis; posterior uveitis; choroiditis; and chorioretinitis;
- psoriasis;
- 10 – multiple sclerosis of whatever type, etiology, or pathogenesis; or multiple sclerosis that is a member selected from the group consisting of primary progressive multiple sclerosis; and relapsing remitting multiple sclerosis;
- autoimmune/inflammatory diseases of whatever type, etiology, or pathogenesis; or an autoimmune/inflammatory disease that is a member selected from the group consisting of
- 15 autoimmune hematological disorders; hemolytic anemia; aplastic anemia; pure red cell anemia; idiopathic thrombocytopenic purpura; systemic lupus erythematosus; polychondritis; scleroderma; Wegner's granulomatosis; dermatomyositis; chronic active hepatitis; myasthenia gravis; Stevens-Johnson syndrome; idiopathic sprue; autoimmune inflammatory bowel
- 20 diseases; ulcerative colitis; Crohn's disease; endocrin opthamopathy; Grave's disease; sarcoidosis; alveolitis; chronic hypersensitivity pneumonitis; primary biliary cirrhosis; juvenile diabetes or diabetes mellitus type I; anterior uveitis; granulomatous or posterior uveitis; keratoconjunctivitis sicca; epidemic keratoconjunctivitis; diffuse interstitial pulmonary fibrosis or interstitial lung fibrosis; idiopathic pulmonary fibrosis; cystic fibrosis; psoriatic arthritis; glomerulonephritis with and without nephrotic syndrome; acute glomerulonephritis; idiopathic
- 25 nephrotic syndrome; minimal change nephropathy; inflammatory/hyperproliferative skin diseases; psoriasis; atopic dermatitis; contact dermatitis; allergic contact dermatitis; benign familial pemphigus; pemphigus erythematosus; pemphigus foliaceus; and pemphigus vulgaris;
- prevention of allogeneic graft rejection following organ transplantation;
- 30 – inflammatory bowel disease (IBD) of whatever type, etiology, or pathogenesis; or inflammatory bowel disease that is a member selected from the group consisting of ulcerative colitis (UC); collagenous colitis; colitis polyposa; transmural colitis; and Crohn's disease (CD);.
- septic shock of whatever type, etiology, or pathogenesis; or septic shock that is a
- 35 member selected from the group consisting of renal failure; acute renal failure; cachexia;

- 52 -

malarial cachexia; hypophysial cachexia; uremic cachexia; cardiac cachexia; cachexia suprarenalis or Addison's disease; cancerous cachexia; and cachexia as a consequence of infection by the human immunodeficiency virus (HIV);

- liver injury;
- 5 - pulmonary hypertension; and hypoxia-induced pulmonary hypertension;
- bone loss diseases; primary osteoporosis; and secondary osteoporosis;
- central nervous system disorders of whatever type, etiology, or pathogenesis; or a central nervous system disorder that is a member selected from the group consisting of depression; Parkinson's disease; learning and memory impairment; tardive dyskinesia; drug
- 10 dependence; arteriosclerotic dementia; and dementias that accompany Huntington's chorea, Wilson's disease, paralysis agitans, and thalamic atrophies;
- infection, especially infection by viruses wherein such viruses increase the production of TNF- α in their host, or wherein such viruses are sensitive to upregulation of TNF- α in their host so that their replication or other vital activities are adversely impacted,
- 15 including a virus which is a member selected from the group consisting of HIV-1, HIV-2, and HIV-3; cytomegalovirus, CMV; influenza; adenoviruses; and Herpes viruses, including *Herpes zoster* and *Herpes simplex*;
- yeast and fungus infections wherein said yeast and fungi are sensitive to upregulation by TNF- α or elicit TNF- α production in their host, e.g., fungal meningitis;
- 20 particularly when administered in conjunction with other drugs of choice for the treatment of systemic yeast and fungus infections, including but are not limited to, polymyxins, e.g., Polymyxin B; imidazoles, e.g., clotrimazole, econazole, miconazole, and ketoconazole; triazoles, e.g., fluconazole and itraconazole; and amphotericins, e.g., Amphotericin B and liposomal Amphotericin B.
- 25 - ischemia-reperfusion injury; autoimmune diabetes; retinal autoimmunity; chronic lymphocytic leukemia; HIV infections; lupus erythematosus; kidney and ureter disease; urogenital and gastrointestinal disorders; and prostate diseases.

In particular, the compounds of Formula (1.0.0) are useful in the treatment of (1) inflammatory diseases and conditions comprising: joint inflammation, rheumatoid arthritis,

30 rheumatoid spondylitis, osteoarthritis, inflammatory bowel disease, ulcerative colitis, chronic glomerulonephritis, dermatitis, and Crohn's disease; (2) respiratory diseases and conditions comprising: asthma, acute respiratory distress syndrome, chronic pulmonary inflammatory disease, bronchitis, chronic obstructive airway disease, and silicosis; (3) infectious diseases and conditions comprising: sepsis, septic shock, endotoxic shock, gram negative sepsis, toxic shock

- 53 -

- syndrome, fever and myalgias due to bacterial, viral or fungal infection, and influenza; (4) immune diseases and conditions comprising: autoimmune diabetes, systemic lupus erythematosus, graft vs. host reaction, allograft rejections, multiple sclerosis, psoriasis, and allergic rhinitis; and (5) other diseases and conditions comprising: bone resorption diseases; 5 reperfusion injury; cachexia secondary to infection or malignancy; cachexia secondary to human acquired immune deficiency syndrome (AIDS), human immunodeficiency virus (HIV) infection, or AIDS related complex (ARC); keloid formation; scar tissue formation; type 1 diabetes mellitus; and leukemia.

- The present invention still further relates to the combination of a compound of 10 Formula (1.0.0) together with one or more members selected from the group consisting of the following: (a) leukotriene biosynthesis inhibitors: 5-lipoxygenase (5-LO) inhibitors and 5-lipoxygenase activating protein (FLAP) antagonists selected from the group consisting of zileuton; ABT-761; fenleuton; tepoxalin; Abbott-79175; Abbott-85761; *N*-(5-substituted)-thiophene-2-alkylsulfonamides of Formula (5.2.8); 2,6-di-*tert*-butylphenol hydrazones of 15 Formula (5.2.10); the class of methoxytetrahydropyrans which includes Zeneca ZD-2138 of Formula (5.2.11); the compound SB-210661 of Formula (5.2.12) and the class to which it belongs; the class of pyridinyl-substituted 2-cyanonaphthalene compounds to which L-739,010 belongs; the class of 2-cyanoquinoline compounds to which L-746,530 belongs; the classes of indole and quinoline compounds to which MK-591, MK-886, and BAY x 1005 20 belong; (b) receptor antagonists for leukotrienes LTB₄, LTC₄, LTD₄, and LTE₄ selected from the group consisting of the phenothiazin-3-one class of compounds to which L-651,392 belongs; the class of amidino compounds to which CGS-25019c belongs; the class of benzoxalamines to which ontazolast belongs; the class of benzenecarboximidamides to which BIIL 284/260 belongs; and the classes of compounds to which zafirlukast, ablukast, 25 montelukast, pranlukast, verlukast (MK-679), RG-12525, Ro-245913, iralukast (CGP 45715A), and BAY x 7195 belong; (c) PDE4 inhibitors including inhibitors of the isoform PDE4D; (d) 5-Lipoxygenase (5-LO) inhibitors; or 5-lipoxygenase activating protein (FLAP) antagonists; (e) dual inhibitors of 5-lipoxygenase (5-LO) and antagonists of platelet activating factor (PAF); (f) leukotriene antagonists (LTRAs) including antagonists of LTB₄, LTC₄, LTD₄, 30 and LTE₄; (g) antihistaminic H₁ receptor antagonists including cetirizine, loratadine, desloratadine, fexofenadine, astemizole, azelastine, and chlorpheniramine; (h) gastroprotective H₂ receptor antagonists; (i) α_1 - and α_2 -adrenoceptor agonist vasoconstrictor sympathomimetic agents administered orally or topically for decongestant use, including propylhexedrine, phenylephrine, phenylpropanolamine, pseudoephedrine, naphazoline 35 hydrochloride, oxymetazoline hydrochloride, tetrahydrozoline hydrochloride, xylometazoline hydrochloride, and ethylnorepinephrine hydrochloride; (j) α_1 - and α_2 -adrenoceptor agonists in combination with inhibitors of 5-lipoxygenase (5-LO); (k) anticholinergic agents including

- 54 -

- ipratropium bromide; tiotropium bromide; oxitropium bromide; pirenzepine; and telenzepine;
- (l) β_1 - to β_4 -adrenoceptor agonists including metaproterenol, isoproterenol, isoprenaline, albuterol, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol mesylate, and pirbuterol; (m) methylxanthanines including theophylline and aminophylline; (n) sodium cromoglycate; (o) muscarinic receptor (M1, M2, and M3) antagonists; (p) COX-1 inhibitors (NSAIDs); COX-2 selective inhibitors including rofecoxib; and nitric oxide NSAIDs; (q) insulin-like growth factor type I (IGF-1) mimetics; (r) ciclesonide; (s) inhaled glucocorticoids with reduced systemic side effects, including prednisone, prednisolone, flunisolide, triamcinolone acetonide, beclomethasone dipropionate, budesonide, fluticasone propionate, and mometasone furoate; (t) tryptase inhibitors; (u) platelet activating factor (PAF) antagonists; (v) monoclonal antibodies active against endogenous inflammatory entities; (w) IPL 576; (x) anti-tumor necrosis factor (TNF α) agents including Etanercept, Infliximab, and D2E7; (y) DMARDs including Leflunomide; (z) TCR peptides; (aa) interleukin converting enzyme (ICE) inhibitors; (bb) IMPDH inhibitors; (cc) adhesion molecule inhibitors including VLA-4 antagonists; (dd) cathepsins; (ee) MAP kinase inhibitors; (ff) glucose-6 phosphate dehydrogenase inhibitors; (gg) kinin-B₁- and B₂-receptor antagonists; (hh) gold in the form of an aurothio group together with various hydrophilic groups; (ii) immunosuppressive agents, e.g., cyclosporine, azathioprine, and methotrexate; (jj) anti-gout agents, e.g., colchicine; (kk) xanthine oxidase inhibitors, e.g., allopurinol; (ll) uricosuric agents, e.g., probenecid, sulfinpyrazone, and benzbromarone; (mm) antineoplastic agents, especially antimitotic drugs including the vinca alkaloids such as vinblastine and vincristine; (nn) growth hormone secretagogues; (oo) inhibitors of matrix metalloproteases (MMPs), i.e., the stromelysins, the collagenases, and the gelatinases, as well as aggrecanase; especially collagenase-1 (MMP-1), collagenase-2 (MMP-8), collagenase-3 (MMP-13), stromelysin-1 (MMP-3), stromelysin-2 (MMP-10), and stromelysin-3 (MMP-11); (pp) transforming growth factor (TGF β); (qq) platelet-derived growth factor (PDGF); (rr) fibroblast growth factor, e.g., basic fibroblast growth factor (bFGF); (ss) granulocyte macrophage colony stimulating factor (GM-CSF); (tt) capsaicin cream; (uu) Tachykinin NK₁ and NK₃ receptor antagonists selected from the group consisting of NKP-608C; SB-233412 (talnetant); and D-4418; and (vv) elastase inhibitors selected from the group consisting of UT-77 and ZD-0892.

DETAILED DESCRIPTION OF THE INVENTION

5.0 Compounds

The present invention is concerned with novel compounds which may be represented by Formula (1.0.0) as follows:

(1.0.0)

The broadest scope of the compounds of the present invention is circumscribed above under Section 4.0 relating to the Summary of the Invention. A further description of said compounds is provided hereafter in terms of a range of different types and groups of embodiments, as well as specific embodiments which characterize and exemplify the compounds of Formula (1.0.0). Preferred and more preferred embodiments of said compounds are also set forth, but it will be understood that the recital of such preferences is in no way intended to, and does not limit the scope of the present invention with regard to said compounds.

As used herein, the expressions " $-(C_1-C_3)$ alkyl", " $-(C_1-C_4)$ alkyl"; and " $-(C_1-C_6)$ alkyl", as well as equivalent variations of the same, are intended to include branched as well as straight chain conformations of these aliphatic groups. Thus, the above-quoted expressions include, in addition to the straight chain entities methyl, ethyl, *n*-propyl, *n*-butyl, *n*-pentyl, and *n*-hexyl, the branched chain entities *iso*-propyl, *iso*-butyl, *sec*-butyl, *tert*-butyl, *iso*-pentane (2-methylbutane), 2-methylpentane, 3-methylpentane, 1-ethylpropane, and 1-ethylbutane. The meanings of the above-quoted expressions are also intended to apply to said expressions whether or not they are substituted. Thus, the expression "fluorinated- $-(C_1-C_3)$ alkyl" is intended to encompass the various fluorinated species of the *n*-propyl and *iso*-propyl aliphatic groups.

As used herein, the expression "saturated or unsaturated carbon ring system that is 3- to 7-membered monocyclic" is intended to include such saturated monocyclic carbon ring systems as cyclopropane, cyclobutane, cyclopentane, cyclohexane, and cycloheptane. The above-quoted expression is also intended to include such mono-unsaturated monocyclic carbon ring systems as cyclopentene, cyclohexene, and cycloheptene; as well as such aromatic monocyclic carbon ring systems as phenylene.

As used herein, the expressions "fused or discontinuous, polycyclic" and "fused polycyclic" are intended to mean first, a carbon ring system having two or more rings, especially bicyclic and tricyclic, more especially bicyclic, in which the rings are fused, *i.e.*,

- 56 -

there is at least one pair of bridgehead carbon atoms present. These polycyclic ring systems may be saturated or unsaturated. Second, the above-quoted expression is intended to mean a carbon ring system having two or more rings in which said rings are discontinuous, *i.e.*, they are attached to each other by a single or double covalent bond and there are no bridgehead carbon atoms present. These polycyclic ring systems may also be saturated or unsaturated.

The moiety J^1 may be discontinuous, while the moiety J^2 may not be discontinuous. It is also provided herein that J^2 may not have the meaning of a moiety which is biaryl or discontinuous. The expression "biaryl" as used herein is intended to mean a fused polycyclic ring system as defined immediately above in which (1) bridgehead carbon atoms are joined by a bond, *i.e.*, there are no additional carbon atoms present between said bridgehead carbon atoms; and (2) heteroatoms, if present, are contained only in a tricyclic or higher polycyclic fused ring system. Further, as already mentioned, J^2 may not be discontinuous, as that expression is defined immediately above.

Consequently, the types of biaryl and discontinuous ring systems that may comprise a meaning of J^1 , but that may not comprise a meaning of J^2 include, *inter alia*, the following: biphenyl; biphenylene; fluorene; 9H-carbazole; phenanthridine; phenanthrene; 2,2'-bipyridine; iminodibenzyl; 2,2'-biquinoline; naphthalene; 2-phenylnaphthalene; 1-phenylnaphthalene; diphenylmethane; 1-phenylpiperadine; 1-phenylpiperazine; bibenzyl; azulene; 4,4'-diphenyl-2,2'-dipyridyl; 1-(diphenylmethyl)azetidine; 4,5-diphenyloxazole; 2,5-diphenyloxazole; diphenyl-2-pyridylmethane and diphenyl-4-pyridylmethane; 3,6-diphenyl-1,2,4,5-tetrazine; 1-benzylpiperazine; 1-benzylpiperidine; 2-benzylpyridine, 3-benzylpyridine and 4-benzylpyridine; 4,5-diphenylimidazole; phenothiazine; phenoxazine; phenazine; 1-phenyl-3,4-dihydronaphthalene; 2-phenylindene; 2-phenylindole; 4-phenylmorpholine; 2-phenylbenzothiazole; 2-phenylbenzoxazole; and 2-phenylbenzimidazole.

The above-recited types of biaryl and discontinuous ring systems may, on the other hand, comprise a meaning of J^1 . As a further illustration, it will be understood that, *e.g.*, a naphthyl moiety is biaryl as defined herein, since it is a fused bicyclic with a bond between the bridgehead carbon atoms, and there are no heteroatoms present. A quinoliny moiety, on the other hand, while also a fused bicyclic with a bond between the bridgehead carbon atoms, is not biaryl as defined herein, since a nitrogen heteroatom is also present, and the definition of "biaryl" requires that in such a case the fused ring system be tricyclic or higher polycyclic. The biphenyl moiety is an example of a discontinuous ring system that, accordingly, may be a meaning of J^1 , but may not be a meaning of J^2 .

As used herein, the expression "saturated or unsaturated carbon ring system that is ... 7- to 12-membered, fused or discontinuous, polycyclic" is intended to include such

- 57 -

saturated fused bi- and tricyclic carbon ring systems as norbornane, bicyclo[2.2.2]octanyl, bicyclo[3.2.1]octanyl, bicyclo[3.3.0]octanyl, bicyclo[3.3.1]nonanyl, cyclodecanyl, and adamantanyl. The above-quoted expression is also intended to include such mono-unsaturated bi- and tricyclic carbon ring systems as norbornenyl, bicyclo[2.2.2]oct-5-enyl, and bicyclo[2.2.2]oct-7-enyl; as well as such aromatic bi- and tricyclic carbon ring systems as naphthylene and biphenylene. The above-quoted expression is further intended to include such aromatic discontinuous bicyclic carbon ring systems as biphenylene.

The carbon ring systems included within the scope of the above-quoted expression and described above also include moieties wherein optionally one carbon atom thereof may be replaced by a heteroatom selected from N, O, or S, and where N is selected, optionally a second carbon atom thereof may be replaced by a heteroatom selected from N, O, and S. The resulting moieties include pyrrolyl; pyrrolidinyl; furanyl; thienyl; pyridyl; pyrimidinyl; piperidinyl; piperazinyl; imidazolyl; imidazolidinyl; oxazolyl; isoxazolyl; thiazolyl; indolyl; quinolyl; isoquinolyl; benzimidazolyl; benzoxazolyl; morpholinyl; quinuclidinyl; and azabicyclo[3.3.0]octanyl.

As used herein with respect to compounds of Formula (1.0.0), as well as other formulas and partial formulas relating thereto, where one or more nitrogen atom components thereof is or are represented as $[N \Rightarrow (O)]$, it or they comprise(s) an optional nitrogen oxide form of said nitrogen atom(s). Where there is more than one such nitrogen oxide form, they are selected independently of each other. Further, it will be appreciated that said nitrogen oxide form(s) may also be represented as " $[N \Rightarrow (O)_u]$ " where u is 0 or 1.

A portion of the core nucleus of the compounds of Formula (1.0.0) is that of a nicotinamide of Formula (1.0.1):

(1.0.1)

derived from nicotinic acid. This portion of the core nucleus is then elaborated by defining the Y moiety as being $=C(R^1)_a-$, or $-[N \Rightarrow (O)_k]-$ where k is 0 or 1, and where the symbol $\Rightarrow (O)$ indicates a nitrogen heteroatom in the form of its N-oxide when k is 1. It should be noted that in the N-containing heterocyclyl moieties which define R^8 , it is provided that optionally one or more of the N-heteroatoms comprising said heterocyclyl moieties may be in the form of the N-

oxide of said N-heteroatoms. Accordingly, the considerations concerning N-oxides just described also apply to such N-oxide-containing moieties defining R^8 .

Where Y has the meaning of $-[N \Rightarrow (O)]_k-$ the compounds of the present invention are pyrimidines. The pyrimidine group of compounds of Formula (1.0.0) is a significant part of
 5 the scope of the present invention. It is preferred, nevertheless, that the compounds of Formula (1.0.0) have the Y moiety defined as $=C(R^1_a)-$ where the substituent R^1_a is selected independently from the other substituents that form the compounds of Formula (1.0.0).

In addition to -H, R^1_a of the $=C(R^1_a)-$ moiety is defined as a member selected from the group consisting of -F; -Cl; -CN; -NO₂; -(C₁-C₄) alkyl; -(C₂-C₄) alkynyl; fluorinated-
 10 (C₁-C₃) alkyl; fluorinated-(C₁-C₃) alkoxy; -OR¹⁶; and -C(=O)NR¹²_aR¹²_b; where R¹²_a and R¹²_b are each independently -H; -CH₃; -CH₂CH₃; -CH₂CH₂CH₃; -CH₂(CH₃)₂; -CH₂CH₂CH₂CH₃; -CH(CH₃)CH₂CH₃; -CH₂CH(CH₃)₂; -C(CH₃)₃; cyclopropyl; cyclobutyl; or cyclopentyl;

However, it is preferred that the R^1_a substituent of the $=C(R^1_a)-$ moiety have the meaning of -H; -F; -Cl; -CH₃; -OCH₃; or -(C₂-C₄) alkynyl; more preferably R^1_a is -F or -H.

15 It will be noted that R^1_a has several substituent definitions, especially -F, in common with those for the R^1 and R^2 substituents on the J^2 moiety. In the embodiments of the compounds of Formula (1.0.0) where Y is $=C(R^1_a)-$, and both the J^1 moiety and the J^2 moiety have the preferred meaning of phenyl, the substituents at the 5-position of the nicotinamide core nucleus and at the 2'-position, of the benzyl group attached to the amide
 20 portion thereof, are selected from the same group of definitions, although on an independent basis. The embodiments of the present invention wherein such substituents are involved, and where j is 1, k is 0, n is 1, both R^C and R^D are -H, and Y is $=C(R^1_a)-$, may be illustrated by generic Formula (1.0.2a) and sub-generic Formula (1.0.2b) as follows:

(1.0.2a)

(1.0.2b)

- 5 In such embodiments of the present invention, the 5-position (R^1_a) and 2'-position (R^1) substituents serve the same function of modulating the properties of the overall compound of Formula (1.0.0) with respect to its pharmacological and pharmacokinetic properties such as potency, substrate specificity (selectivity), and physico-chemical properties. In preferred embodiments of the compounds of the present invention of this type,
- 10 both the R^1 and R^1_a substituents will have the same meaning, which will be -H or -F.

5.1.0 Terminal Moiety D Is a Moiety of Partial Formulas (1.1.1) – (1.1.9)

- D is a member selected from the group of moieties defined by partial Formulas (1.1.1) through (1.1.9) illustrated further above. The moieties of partial Formulas (1.1.1) through (1.1.5) which define the D group are typically but not necessarily acids, amides, and
- 15 heterocyclyl groups that act as acid and amide mimetics, but they are not limited to these types of functional groups. The moieties of partial Formulas (1.1.6) through (1.1.9) which define the D group are typically but not necessarily tertiary alcohols and their mimetics, especially analogous acyl and nitrile moieties, but they are not limited to these types of functional groups. Other moieties as described herein may be employed at the right-hand-
- 20 side of the compounds of Formula (1.0.0). These moieties are biosostereic in that they permit the compounds of Formula (1.0.0) containing them to achieve PDE4 inhibition

essentially equivalent to that achieved by other moieties, especially acid, amide, and alcohol moieties.

5.1.1 **D** Is a Moiety of Partial Formulas (1.1.1), (1.1.2), or (1.1.3)

Embodiments of the present invention wherein the definition of the **D** group is illustrated by partial Formulas (1.1.1); (1.1.2); and (1.1.3), are as follows:

One of a number of preferred moieties for defining the **D** group is that of partial Formula (1.1.1) where R^7 has the meaning of $-H$, which is a preferred meaning of this substituent. Where R^7 is hydrogen and m is 1, 2, or 3 in Formula (1.0.0), a simple carboxylic acid $-COOH$ results, and the group becomes a lower alkanic acid. Benzoic acid as a meaning of the **D** group, however, is a less preferred embodiment of the present invention.

R^{10} is an optional substituent of the moieties that define R^7 , and there may be up to three such substituents when present. The meaning of the R^{10} substituent includes phenyl or pyridyl where said phenyl or pyridyl is in turn optionally substituted by up to 3 substituents R^{11} where R^{11} is $-F$, $-Cl$, $-CN$, $-NO_2$, $-OH$, $-(C_1-C_3)$ alkoxy, $-(C_1-C_3)$ alkyl, or $-NR^{16}R^{17}$. In preferred embodiments that include such R^{11} substitution, there will be 1 or 2 substituents R^{11} that have the meaning of $-F$, $-Cl$, $-CH_3$, $-OCH_3$, $-OH$, $-CN$, or $-N(CH_3)_2$. Preferably, there is 0 or 1 such R^{11} substituent and when present it is $-F$ or $-Cl$. The meaning of the R^{10} substituent further includes $-F$, $-Cl$, $-CF_3$, oxo ($=O$), $-OR^{16}$, $-NO_2$, $-CN$, $-C(=O)OR^{16}$, $-O-C(=O)R^{16}$, $-C(=O)NR^{16}R^{17}$, $-O-C(=O)NR^{16}R^{17}$, $-NR^{16}R^{17}$, $-NR^{16}C(=O)R^{17}$, $-NR^{16}C(=O)OR^{17}$, $-NR^{16}S(=O)_2R^{17}$, or $-S(=O)_2NR^{16}R^{17}$.

The sub-substituents R^{16} and R^{17} comprise $-H$; $-(C_1-C_4)$ alkyl, preferably $-CH_3$; $-(C_2-C_4)$ alkenyl; $-(C_3-C_6)$ cycloalkyl, preferably cyclopropyl; phenyl; benzyl; or pyridyl. Said alkyl, alkenyl, cycloalkyl, phenyl, benzyl, or pyridyl groups are in turn optionally substituted by up to 3 substituents $-F$, $-Cl$, or $-CN$. Among the above-recited additional meanings of R^{10} , it is preferred that the R^{10} substituent when present be pyridyl optionally substituted by $-F$, $-Cl$, $-OCH_3$, $-CN$, $-NO_2$, or $-NR^{16}R^{17}$ where R^{16} and R^{17} are independently $-H$ or $-CH_3$; or that the R^{10} substituent when present be $-F$, $-Cl$, $-CF_3$, $-CN$, $-NO_2$, $-C(=O)OR^{16}$, or $-NR^{16}R^{17}$ where R^{16} and R^{17} are independently $-H$ or $-CH_3$.

These and other preferred embodiments of the compounds of Formula (1.0.0) comprising the moieties of partial Formula (1.1.1) based on the preferred meanings of R^7 and

R⁹ as described above, include, *inter alia*, the following groups illustrated by partial Formulas (3.5.1) through (3.5.15):

The **D** group is represented by partial Formula (1.1.2) in which the nitrogen atom is substituted by R⁹ where R⁹ has the meaning of -H; -(C₁-C₄) alkyl; -(C₃-C₇) cycloalkyl; phenyl; benzyl; -C(=O)OR¹⁶; -C(=O)R¹⁶; -OR¹⁶; -(C₁-C₂) alkyl-OR¹⁶; or -(C₁-C₂) alkyl-C(=O)OR¹⁶; where R¹⁶ is -H or -(C₁-C₄) alkyl. R¹⁶ is preferably -H or -CH₃.

Accordingly, embodiments of the present invention where the **D** group is represented by partial Formula (1.1.2) may be illustrated as follows by partial Formulas (4.1.1) through (4.1.5):

Those embodiments wherein the definition of **D** is that of an amide group, are illustrated by partial Formula (1.1.3):

(1.1.3)

These and other preferred embodiments of the compounds of Formula (1.0.0) comprising moieties of partial Formula (1.1.3), based on the meanings of R⁷ and R⁹ described above, include, *inter alia*, the following groups illustrated by partial Formulas (4.5.1) through (4.5.20):

5.1.2 D Is a Moiety of Partial Formula (1.1.4)

Preferred embodiments of the present invention also comprise those compounds of Formula (1.0.0) wherein terminal moiety **D** falls within the scope of partial Formula (1.1.4), *i.e.*, embodiments of this type are encompassed within the scope of the **D** moiety when it has

5 the meaning of partial Formula (1.1.4):

(1.1.4)

wherein R^8 is a monocyclic or bicyclic heterocyclyl which is a member selected from the group consisting of tetrazol-5-yl; 1,2,4-triazol-3-yl; 1,2,4-triazol-3-on-5-yl; 1,2,3-triazol-5-yl; imidazol-2-yl; imidazol-4-yl; imidazolidin-2-on-4-yl; 1,2,4-oxadiazol-3-yl; 1,2,4-oxadiazol-5-on-3-yl; 1,2,4-oxadiazol-5-yl; 1,2,4-oxadiazol-3-on-5-yl; 1,3,4-oxadiazolyl; 1,3,4-oxadiazol-2-on-5-yl; oxazolyl; isoxazolyl; pyrrolyl; pyrazolyl; succinimidyl; glutarimidyl; pyrrolidonyl; 2-piperidonyl; 2-pyridonyl; 4-pyridonyl; pyridazin-3-onyl; pyridazin-3-onyl; thiazolyl; isothiazolyl; thiadiazolyl; morpholinyl; parathiazinyl; pyridyl; pyrimidinyl; pyrazinyl; pyridazinyl; indolyl; indolinyl; isoindolinyl; benzo[*b*]furanyl; 2,3-dihydrobenzofuranyl; 1,3-dihydroisobenzofuranyl; 2*H*-1-benzopyranyl; 2-*H*-chromenyl; chromanyl; benzothienyl; 1*H*-indazolyl; benzimidazolyl; benzoxazolyl; benzisoxazolyl; benzothiazolyl; benzotriazolyl; benzotriazinyl; phthalazinyl; 1,8-naphthyridinyl; quinolinyl; isoquinolinyl; quinazolinyl; quinoxalinyl; pyrazolo[3,4-*d*]pyrimidinyl; pyrimido[4,5-*d*]pyrimidinyl; imidazo[1,2-*a*]pyridinyl; pyridopyridinyl; pteridinyl; and 1*H*-purinyl.

20 Partial Formulas (1.1.3) and (1.1.4) are similar and the distinction between them should be noted. Partial Formulas (1.1.3) and (1.1.4) are as follows:

25 Where v is 0, R^8 is linked in a direct fashion to the remaining portion of a compound of Formula (1.0.0) and it is, accordingly, readily distinguishable from a moiety of partial Formula (1.1.3) in which R^7 is linked to the remaining portion of a compound of Formula (1.0.0) through the amide bridging moiety $—C(=O)NR^9—$. Where v is 1, on the other hand, both the R^8 and the R^7 moieties are linked to the remaining portion of a compound of Formula (1.0.0) through the amide bridging moiety $—C(=O)NR^9—$. In this instance, the distinction

between the moieties of partial Formulas (1.1.3) and (1.1.4) comprises the difference between the meanings of the R^6 and the R^7 moieties. This difference has already been described above in detail.

In order to facilitate the following description, the monocyclic heterocyclyl moieties and the bicyclic heterocyclyl moieties are first treated together and thereafter are discussed as separate groups.

Any one or more of the carbon atoms of the phenyl, benzyl, or heterocyclyl moiety is substituted by 0 to 3 substituents R^{14} where R^{14} has the meanings and preferred meanings already described above with regard to partial Formulas (1.1.1), (1.1.2), and (1.1.3). Any one or more of the nitrogen atoms, which it will be appreciated occur only in the case of the heterocyclyl moieties, and which are not a point of attachment of said heterocyclyl moiety, are optionally substituted by up to 3 substituents R^{15} . Any sulfur atom which happens to occur in a heterocyclyl moiety, that is not a point of attachment of said heterocyclyl moiety, is substituted by 0, 1, or 2 oxygen atoms.

The optional nitrogen heterocyclyl substituent R^{16} comprises $-H$; $-NR^{18}R^{17}$; $-C(=O)R^{16}$; $-OR^{16}$, preferably $-OCH_3$; $-(C_1-C_4)$ alkyl- OR^{16} ; $-C(=O)OR^{16}$; $-(C_1-C_2)$ alkyl- $C(=O)OR^{16}$; $-C(=O)NR^{18}R^{17}$; $-(C_1-C_4)$ alkyl, preferably $-CH_3$; $-(C_2-C_4)$ alkenyl; $-(CH_2)_u-(C_3-C_7)$ cycloalkyl where u is 0, 1 or 2, preferably cyclopropyl; phenyl; benzyl; pyridyl; or quinolinyl. The alkyl, alkenyl, alkoxy, cycloalkyl, phenyl, benzyl, pyridyl and quinolinyl groups thus included are optionally substituted with up to 2 substituents R^{12} .

The sub-substituent R^{12} comprises $-F$; $-Cl$; $-CO_2R^{18}$; $-OR^{18}$; $-CN$; $-C(=O)NR^{18}R^{19}$; $-NR^{18}R^{19}$; $-NR^{18}C(=O)R^{19}$; $-NR^{18}C(=O)OR^{19}$; $-NR^{18}S(=O)_pR^{19}$; $-S(=O)_pNR^{18}R^{19}$, where p is 1 or 2, preferably 2; $-(C_1-C_4)$ alkyl, preferably $-CH_3$; and $-(C_1-C_4)$ alkoxy, where R^{12} has the meaning of $-OR^{18}$ above and R^{18} is defined as $-(C_1-C_4)$ alkyl, and preferably R^{12} is $-OCH_3$; where said alkyl and alkoxy are in turn optionally substituted with up to 3 substituents $-F$; $-Cl$; $-(C_1-C_2)$ alkoxycarbonyl; $-(C_1-C_2)$ alkylcarbonyl; and $-(C_1-C_2)$ alkylcarbonyloxy. The R^{18} and R^{19} substituents are independently selected from $-H$; $-(C_1-C_2)$ alkyl, preferably $-CH_3$; or phenyl; and are optionally substituted with up to 3 $-F$; or $-Cl$.

No R^9 substituents are shown in partial Formulas (1.1.11) through (1.1.34) above, as well as further below, because the R^9 substituent is attached only to a nitrogen atom that does not form an integral, component part of an attached heterocyclic moiety. The R^9 substituent is optional in character in that " $-H$ " is included as a definition of the R^9 substituent, and in many of the embodiments of the compounds of Formula (1.0.0) this is the preferred meaning of R^9 . Another preferred meaning of R^9 is $-CH_3$.

There is also pointed out the distinction between the substituents R^9 and R^{15} , both of which are attached only to nitrogen atoms in any of the meanings of the moiety **D**. The substituent R^{15} is attached only to a nitrogen atom that is an integral, component part of any heterocyclic moiety that may be defined *via* the R^8 substituent of partial Formula (1.1.4) and in particular with reference to the more specific heterocyclic moieties of partial Formulas (1.1.11) through (1.1.34), shown above as well as further below. The R^9 substituent, on the other hand, is attached only to a nitrogen atom that in turn is attached to, but is not an integral, component part of any of the heterocyclic moieties that is defined by partial Formulas (1.1.2), (1.1.3), and (1.1.5). The R^{15} substituent may be attached to one or more nitrogen atoms and said nitrogen atoms may be present in any moieties falling within the scope of partial Formula (1.1.4) that can be characterized as containing or comprising a nitrogen-containing heterocyclic moiety.

As an illustration of preferred subgeneric embodiments of the present invention wherein the **D** group has the meaning of a moiety that falls within the scope of partial Formula (1.1.4), there is set out below the groups of partial Formulas (1.1.11) through (1.1.44):

tetrazol-5-yl
(1.1.11)

1,2,4-triazol-3-yl
(1.1.12)

1,2,4-triazol-3-on-5-yl
(1.1.13)

1,2,3-triazol-5-yl
(1.1.14)

imidazol-2-yl
(1.1.15)

imidazol-4-yl
(1.1.16)

imidazolidin-2-on-4-yl
(1.1.17)

1,3,4-oxadiazolyl
(1.1.18)

1,3,4-oxadiazol-2-on-5-yl
(1.1.19)

1,2,4-oxadiazol-3-yl
(1.1.20)

1,2,4-oxadiazol-5-on-3-yl
(1.1.21)

1,2,4-oxadiazol-5-yl
(1.1.22)

In order to provide another demonstration of preferred embodiments of the compounds of Formula (1.0.0) with reference to the **D** group where it is a moiety of partial

Formula (1.1.4) and v is 0 or 1, and R^8 is a monocyclic heterocyclic group, there is set out below the groups consisting of partial Formulas (4.8.1) through (4.8.80) from which the D moiety is selected in such preferred embodiments:

(4.8.1)

(4.8.2)

- Preferred embodiments of the present invention where the group **D** is a moiety of partial Formula (1.1.4) and *v* is 0 or 1, also include those wherein the moiety R^8 is a bicyclic heterocyclic group selected from the group consisting of indolyl; indolyl; isoindolyl; benzo[*b*]furanyl; 2,3-dihydrobenzofuranyl; 1,3-dihydroisobenzofuranyl; 2*H*-1-benzopyranyl; 2-*H*-chromenyl; chromanyl; benzothienyl; 1*H*-indazolyl; benzimidazolyl; benzoxazolyl; benzisoxazolyl; benzothiazolyl; benzotriazolyl; benzotriazinyl; phthalazinyl; 1,8-naphthyridinyl; quinolyl; isoquinolyl; quinazolyl; quinoxalyl; pyrazolo[3,4-*d*]pyrimidinyl; pyrimido[4,5-*d*]pyrimidinyl; imidazo[1,2-*a*]pyridinyl; pyridopyridinyl; pteridinyl; and 1*H*-purinyl.

- In order to provide a still further demonstration of preferred embodiments of the compounds of Formula (1.0.0) with reference to the **D** group where it is a moiety of partial Formula (1.1.4), *v* is 0 or 1, and R^8 is a bicyclic heterocyclic group, there is set out below the groups consisting of partial Formulas (5.0.1) through (5.0.28) from which the **D** moiety is selected in such preferred embodiments:

indolyl
(5.0.1)

indolyl
(5.0.2)

isoindolyl
(5.0.3)

benzo[b]furanyl
(5.0.4)

2,3-dihydrobenzofuranyl
(5.0.5)

1,3-dihydroisobenzofuranyl; phthalanyl
(5.0.6)

2H-1-benzopyranyl
(5.0.7)

chromanyl
(5.0.8)

benzothienyl
(5.0.9)

1H-Indazolyl
(5.0.10)

benzimidazolyl
(5.0.11)

benzoxazolyl
(5.0.12)

benzisoxazolyl
(5.0.13)

benzothiazolyl
(5.0.14)

2H-1,2-benzothiazinyl
(5.0.15)

benzotriazolyl
(5.0.16)

quinolyl
(5.0.17)

isoquinolyl
(5.0.18)

1,8-naphthyridinyl
(5.0.19)

phthalazinyl
(5.0.20)

quinazolyl
(5.0.21)

quinoxalyl
(5.0.22)

1H-pyrazolo[3,4-d]-
pyrimidinyl
(5.0.23)

pyrimido[5,4-d]-
pyrimidinyl
(5.0.24)

- 71 -

where "*" indicates the point of attachment to the remaining portion of Formula (1.0.0); and where each carbon atom is optionally substituted by a substituent R^{14} ; and where R^{14} and R^{15} have the same meaning as defined above; and all tautomer forms, and optionally N-oxide forms, thereof.

5 5.1.3 D Is a Moiety of Partial Formula (1.1.5)

There are further embodiments of the compounds of Formula (1.0.0) in which the **D** moiety comprises a group falling within the scope of partial Formula (1.1.5):

(1.1.5)

- 10 wherein q is 1, 2, or 3, provided that where q is 2 or 3, R^9 has the meaning of $-H$ in at least one instance, or two instances, respectively; W^3 is $-O-$; $-N(R^9)-$; or $-OC(=O)-$ where R^9 has the same meaning as defined above; and R^7 has the same meaning as defined above.

- 15 In preferred embodiments of the compounds of partial Formula (1.1.5), q is 1 or 2, R^9 is $-H$, or $-CH_3$; W^3 is $-O-$, $-O(C=O)-$, or $-NH-$; and R^7 is one of the preferred moieties already described above.

Representative embodiments of the compounds of Formula (1.0.0) in which the **D** moiety falls within the scope of partial Formula (1.1.5) are those illustrated by partial Formulas (6.0.1) through (6.0.6):

- 72 -

(6.0.1)

(6.0.2)

(6.0.3)

(6.0.4)

(6.0.5)

(6.0.6)

5.1.4 D Is Other Than a Carboxylic Acid

- Embodiments of the compounds of Formula (1.0.0) include those wherein the D moiety is other than a carboxylic acid and is, instead, a phosphorus or sulfur acid or a derivative thereof. There are a significant number of such derivatives from which the D moiety may be selected, and they include the following:
- O-P(=O)(OH)₂ (phosphoric);
 - PH(=O)OH (phosphinic); -P(=O)(OH)₂ (phosphonic); -[P(=O)(OH)-O(C₁-C₄) alkyl] (alkylphosphono); -P(=O)(OH)-O(C₁-C₄) alkyl (alkylphosphinyl); -P(=O)(OH)NH₂ (phosphoramido); -P(=O)(OH)NH(C₁-C₄) alkyl and -P(=O)(OH)NHR²⁵ (substituted phosphoramido); -O-S(=O)₂OH (sulfuric); -S(=O)₂OH (sulfonic); -S(=O)₂NHR²⁶ or -NHS(=O)₂R²⁶ (sulfonamido) where R²⁶ is -CH₃, -CF₃, or o-toluy; and acylsulfonamido selected from the group consisting of -C(=O)NHS(=O)₂R²⁵; -C(=O)NHS(=O)₂NH₂; -C(=O)NHS(=O)₂(C₁-C₄) alkyl; -C(=O)NHS(=O)₂NH(C₁-C₄) alkyl; -C(=O)NHS(=O)₂N[(C₁-C₄) alkyl]₂; -S(=O)₂NHC(=O)(C₁-C₄) alkyl; -S(=O)₂NHC(=O)NH₂; -S(=O)₂NHC(=O)NH(C₁-C₄) alkyl; -S(=O)₂NHC(=O)N[(C₁-C₄) alkyl]₂; -S(=O)₂NHC(=O)R²⁵; -S(=O)₂NHCN; -S(=O)₂NHC(=S)NH₂; -S(=O)₂NHC(=S)NH(C₁-C₄) alkyl; -S(=O)₂NHC(=S)N[(C₁-C₄) alkyl]₂; and -S(=O)₂NHS(=O)₂R²⁵; where R²⁵ is -H; -(C₁-C₄) alkyl; phenyl; or -OR¹⁶, where R¹⁶ has the same meaning as defined above.

- Preferred embodiments of the compounds of Formula (1.0.0) wherein D is a phosphorus or sulfur acid or a derivative thereof, are those wherein D is -P(=O)(OH)NHR²⁵ (substituted phosphoramido); -S(=O)₂NHR²⁶ or -NHS(=O)₂R²⁶ (sulfonamido); or -C(=O)NHS(=O)₂R²⁵ (acylsulfonamido); where R²⁶ and R²⁵ has the same meaning as defined above. Some of these preferred embodiments may be illustrated by partial Formulas (6.5.1) through (6.5.9):

- 73 -

5.1.5 D Is a Moiety of Partial Formulas (1.1.6) through (1.1.9)

There are further embodiments of the compounds of Formula (1.0.0) in which the D moiety comprises a group falling within the scope of partial Formulas (1.1.6) through (1.1.9):

(1.1.6)

(1.1.7)

(1.1.8)

(1.1.9)

5

where R^7 , R^8 , R^{16} , and R^{17} have the same meaning as defined above. For example, R^{16} and R^{17} are each independently selected from -H; $-(C_1-C_4)$ alkyl; $-(C_2-C_4)$ alkenyl; $-(C_3-C_6)$ cycloalkyl; phenyl; benzyl; and pyridyl; wherein said alkyl, alkenyl, cycloalkyl, phenyl, benzyl, or pyridyl is substituted by 0 to 3 substituents selected from the group consisting of -F, -Cl, -CF₃, -CN, and $-(C_1-C_3)$ alkyl.

10

The keto groups of partial Formulas (1.1.6) and (1.1.9) are the same with respect to the carbonyl linking entity, but differ with respect to the attached group, R^7 or R^8 :

(1.1.6)

(1.1.9)

15

R^7 in the moiety of partial Formula (1.1.6) has the same meaning as defined further above, but in preferred embodiments of the compounds of Formula (1.0.0) R^7 has especially the meaning of -H; $-(C_1-C_6)$ alkyl, preferably methyl, ethyl, *iso*-propyl, or *tert*-butyl; $-(C_2-C_6)$ alkenyl, preferably 2-propenyl; $-(C_2-C_6)$ alkynyl, preferably ethynyl. Each of these meanings of R^7 is optionally substituted by up to 3 substituents R^{10} . The meaning of R^{10} is the same as defined above, but is preferably phenyl or pyridyl optionally substituted by up to 3 R^{11} where R^{11} is preferably -F, -CF₃, -CN, -CH₃, or -OCH₃. R^{10} also preferably has the meaning of -F, -CF₃, -OR¹⁶, -CN; $-C(=O)OR^{16}$, $-C(=O)NR^{16}R^{17}$, $-NR^{16}R^{17}$; or -

20

- 74 -

$\text{NR}^{16}\text{S}(=\text{O})_2\text{R}^{17}$, where R^{16} and R^{17} are preferably -H, methyl, ethyl, cyclopropyl, phenyl, benzyl, or pyridyl optionally substituted by up to 3 of -F, or 1 of -CF₃, -CN, or -CH₃.

R^7 also has the meaning of $-(\text{CH}_2)_u-(\text{C}_3-\text{C}_7)$ cycloalkyl where u is preferably 0 or 1 and where (C_3-C_7) cycloalkyl is preferably cyclopropyl, cyclopentyl, or cyclohexyl optionally substituted by up to 3 substituents R^{10} where R^{10} has the same preferred meanings as defined in the paragraph immediately above.

R^7 also has the meaning of phenyl or benzyl, where said phenyl or benzyl optionally substituted by up to 3 substituents R^{10} where R^{10} has the same preferred meanings as defined in the paragraph immediately above.

R^8 in the moiety of partial Formula (1.1.9) has the same meaning as defined further above, but in preferred embodiments of the compounds of Formula (1.0.0) R^8 has especially the meaning of tetrazol-5-yl; 1,2,4-triazol-3-yl; 1,2,3-triazol-5-yl; imidazol-2-yl; imidazol-4-yl; 1,3,4-oxadiazolyl; 1,2,4-oxadiazol-3-yl; 1,2,4-oxadiazol-5-yl; 1,2,5-thiadiazolyl; 1,3,4-thiadiazolyl; morpholinyl; oxazolyl; isoxazolyl; thiazolyl; isothiazolyl; pyrrolyl; pyrazolyl; pyridyl; indolyl; benzo[b]furanyl; 2,3-dihydrobenzofuranyl; 1*H*-indazolyl; benzimidazolyl; benzoxazolyl; benzisoxazolyl; benzothiazolyl; benzotriazolyl; quinolinyl; isoquinolinyl; quinazolinyl; or quinoxalinyl.

Any of the above-recited especially preferred meanings of R^8 is optionally substituted on a carbon atom by R^{14} where R^{14} has the same meaning as defined above; and on a nitrogen atom by R^{15} where R^{15} has the same meaning as defined above. Especially included in the case of such nitrogen atom substituents, are all tautomer forms of the moieties of partial Formula (1.1.9). Sulfur atoms of said moieties are optionally substituted by 1 or 2 oxygen atoms.

In order to illustrate further meanings of **D** that fall within the scope of partial Formulas (1.1.6), (1.1.7), (1.1.8), and (1.1.9), there are depicted below moieties of partial Formulas (3.3.1) through (3.3.15) that represent different meanings that fall within the scope partial Formula (1.1.7):

- 77 -

5.2 Linkage W¹ and (R⁴-, R⁵-, and R⁶)-Substituted Moiety J¹

The nicotinamide core nucleus is further elaborated by allowing the 2-carbon atom in the pyridyl or pyrimidinyl ring of said nucleus to form a linkage to a ring comprising the moiety J¹. In preferred embodiments, the moiety J¹ has the meaning of a phenyl ring which is *para*-

- 5 substituted by a moiety R⁶, *meta*-substituted by a moiety R⁵, or substituted on any of the remaining positions by a moiety R⁴, resulting in a moiety of partial Formula (1.0.3):

- 78 -

(1.0.3)

where W^1 has the meaning $-O-$; $-S(=O)_t-$, where t is 0, 1, or 2; or $-N(R^3)-$ where R^3 is $-H$; $-(C_1-C_3)$ alkyl; phenyl; benzyl; or $-OR^{16}$; and is preferably $-H$ or $-CH_3$.

- 5 In other embodiments of the present invention, W^1 has the meaning $-S(=O)_t-$, where t is 0, 1, or 2; and preferably has the meaning $-S-$ whereby a thioether linkage is formed. Where the sulfur atom of the thioether linkage is oxygenated, a sulfinyl or a sulfonyl linkage results. In still further embodiments, where W^1 has the meaning of $-N(R^3)-$, an amino linkage is formed, which preferably will be $-NH-$. Nevertheless, the nitrogen atom may be substituted
10 and where this is the case, it is preferred that said substituent be $-CH_3$.

- The meanings of the R^4 , R^5 and R^6 substituents are selected from the same set of definitions, but it will be understood that said meanings are selected on an independent basis from each other. R^5 and R^6 may also be $-H$. Accordingly, where the moiety J^1 has the meaning of a phenyl ring, the *para*- (R^6), *meta*- (R^5), or *ortho*- (R^4)-position of the phenyl ring
15 may be substituted, or all three positions may be substituted, or any combination of said positions may be substituted. It is preferred, however, in the compounds of Formula (1.0.0) that the *para*- and/or *meta*-positions be substituted, rather than the *ortho*-position.

- Where the moiety J^1 has the preferred meaning of a phenyl ring, R^5 and R^6 may also be taken together to form a member selected from a group of partial formulas described in
20 more detail further below. Some of these meanings of R^5 and R^6 taken together also constitute preferred embodiments of the compounds of Formula (1.0.0)

- R^5 and R^6 may be $-H$. In addition to $-H$, R^5 and R^6 may, *inter alia*, be $-F$; $-Cl$; $-CN$; $-NO_2$; $-C(=O)R^{16}$; $-OR^{16}$; $-C(=O)OR^{16}$; or $-NR^{16}R^{17}$. Where R^5 is $-H$ and R^6 is $-F$, preferred
25 embodiments of the present invention result. In a further preferred embodiment of the present invention, R^5 and R^6 may also be $-OR^{16}$, where R^{16} is hydrogen; (C_1-C_4) alkyl; or (C_3-C_6) cycloalkyl; wherein said alkyl and cycloalkyl are substituted by 0 to 3 substituents selected from the group consisting of $-F$ and $-Cl$. Other preferred embodiments are those wherein R^{16} is methyl; difluoromethyl; ethyl; or cyclopentyl.

The medicinal chemist will appreciate that the choice of substituents from those described above will be influenced by the effect which such substituents have in turn on the physico-chemical properties of the overall molecules which result. The present state of the art provides the capability of quickly and facily synthesizing a very large number of chemically very similar compounds based on the substituent choices outlined above, and of thereafter testing the relative effectiveness of the resulting molecules in rapid *in vitro* testing methods. Combinatorial chemistry synthesis and testing procedures currently available in the art have even more considerably expanded the number of substituent combinations which can be rapidly evaluated. The information which has thereby been produced through use of these techniques permits a reasonable prediction herein of certain preferences which exist as to various embodiments of the present invention. Such preferred embodiments are described in detail herein.

Preferred embodiments of the present invention further include those wherein both R^5 and R^6 are both $-F$; wherein R^5 is $-H$ and R^6 is $-F$; and wherein R^5 is $-H$ and R^6 is $-F$; $-OR^{18}$, e.g., $-OCH_3$, $-OCH_2F$, $-OCHF_2$, or $-OCF_3$; $-CN$; $-COOH$; $-COOCH_3$; $-CONH_2$; $-OCOCH_3$; or NH_2 . The most preferred embodiments are those wherein R^5 is $-H$ and R^6 is $-F$; R^5 is $-CN$ and R^6 is $-H$; and R^5 is $-NO_2$, $-NH_2$, $-CN$, $-OCH_3$, or $-C(=O)CH_3$, and R^6 is $-H$.

R^5 and R^6 may also be selected from substituents comprising $-(C_1-C_4)$ alkyl and $-(C_1-C_4)$ alkoxy wherein said alkyl and alkoxy are substituted with 0 to 3 substituents $-F$ or $-Cl$; or 0 or 1 substituent (C_1-C_2) alkoxycarbonyl-; (C_1-C_2) alkylcarbonyl-; or (C_1-C_2) alkylcarbonyloxy-.

5.3.0 J^1 Is Phenyl and R^5 and R^6 Are Taken Together

Where the moiety J^1 has the preferred meaning of a phenyl ring, R^5 and R^6 may also be taken together to form a moiety which is a member selected from the group consisting of partial Formulas (1.3.1) through (1.3.15):

wherein R^{20} and R^{21} are each a member independently selected from the group consisting of $-H$; $-F$; $-Cl$; $-CH_3$; $-CH_2F$; $-CHF_2$; $-CF_3$; $-OCH_3$; and $-OCF_3$; and R^{23} and R^{24} are each
 5 independently $-H$; $-CH_3$; $-OCH_3$; $-CH_2CH_3$; $-OCH_2CH_3$; $-CH_2CH_2CH_3$; $-CH_2(CH_3)_2$; $-CH_2CH_2CH_2CH_3$; $-CH(CH_3)CH_2CH_3$; $-CH_2CH(CH_3)_2$; $-C(CH_3)_3$; or absent, in which case the dashed line $---$ represents a double bond. For the moiety of partial Formula (1.3.13) the nitrogen atom components thereof are represented as $-[N(\rightleftharpoons O)]-$ and thus comprise optional nitrogen oxide forms of said nitrogen atoms, selected independently of each other. It will be
 10 appreciated that said nitrogen oxide form may also be represented as $-N(\rightleftharpoons O)_j-$ where j is 0 or 1, as in Formula (1.0.0).

Where the moiety J^1 has the preferred meaning of a phenyl ring, and where R^5 and R^6 are taken together to form the moiety of partial Formula (1.3.1), and R^{20} and R^{21} are both hydrogen, there is formed together with the phenyl group to which it is attached, a 1,3-benzodioxole group. Analogously, the structure of partial Formula (1.3.4) forms a 1,4-benzodioxan group.
 15

Where the moiety J^1 has the preferred meaning of a phenyl ring, and where R^5 and R^6 are taken together to form the moieties of partial Formulas (1.3.1) through (1.3.15), and R^{23} and R^{24} are as defined, benzofurazan, benzothiazan, triazole, and other analogous groups, as well as substituted derivatives thereof are formed, including, *inter alia*, the
 20 following moieties of partial Formulas: (2.1.1) through (2.1.20):

wherein the dashed line ----- in partial Formulas (2.1.18), (2.1.19), and (2.1.20) represents a double bond where no oxygen atom is attached to the corresponding nitrogen atom, and represents a single bond where an oxygen atom is attached to said corresponding nitrogen atom.

- 5 The artisan of ordinary skill in the preparation of organic molecules will appreciate that the compounds of Formula (1.0.0) wherein R^5 and R^6 are taken together to form moieties of the above-illustrated partial Formulas (2.1.2), (2.1.3), (2.1.7), (2.1.8), (2.1.10), (2.1.12), and (2.1.14) exist in tautomeric form, and each moiety of said partial Formulas (2.1.2), (2.1.3), (2.1.7), (2.1.8), (2.1.10), (2.1.12), and (2.1.14) has a tautomer counterpart. These tautomers
- 10 are related by the shift of a hydrogen and one or more π -bonds, and whenever necessary, the skilled artisan will be able to readily discern or determine which tautomeric form is present or is the most stable.

- Still more preferred embodiments of the type comprising the moieties of partial Formulas (2.1.1) through (2.1.20) illustrated above are those wherein R^5 and R^6 are taken
- 15 together to form a moiety which is a member selected from the group consisting of partial Formulas (2.1.1), (2.1.4) through (2.1.6), (2.1.11), and (2.1.16) through (2.1.20):

- 82 -

wherein the dashed line ---- in partial Formulas (2.1.18), (2.1.19), and (2.1.20) represents a double bond where no oxygen atom is attached to the corresponding nitrogen atom, and represents a single bond where an oxygen atom is attached to said corresponding nitrogen atom.

- 5 Preferred embodiments of the present invention result directly from the definition of R^5 and R^6 as taken together to form a moiety which is a member selected from the group consisting of partial Formulas (1.3.1), (1.3.11), (1.3.12), and (1.3.15):

- 10 Accordingly, there further results moieties of partial Formulas (1.0.15) through (1.0.18):

- 15 where R^{23} is $-H$ or $-CH_3$; and W has the meaning of $-O-$; $-S(=O)_t-$ where t is 0, 1, or 2; or $-N(R^3)-$ where R^3 is as defined herein and is preferably $-H$ or $-CH_3$. In preferred compounds of Formula (1.0.0), W has the meaning of $-O-$ whereby an ether linkage is created to attach the benzo-fused, bicyclic heterocycle to the nicotinamide core nucleus.

- 20 In preferred embodiments of the compounds of Formula (1.0.0), R^{23} and R^{24} are both absent, except in compounds of the type illustrated by partial Formula (1.3.11), where only one of R^{23} or R^{24} may be absent. It will be recognized that where R^{23} and R^{24} are both absent, and the dashed lines: - - - accordingly represent double bonds, that the phenyl

- 83 -

portion of the resulting benzo-fused bicyclic heterocycles depicted cannot have all of the double bonds depicted in said partial Formulas, since the result would be prohibited pentavalent carbon atoms in said phenyl portion.

Accordingly, where R^{23} and R^{24} are both absent, the resulting compounds are
 5 characterized by such structures as those shown in partial Formulas (1.0.16) and (1.0.17) above.

In other embodiments of the compounds of Formula (1.0.0) the substituents R^{20} and R^{21} on the benzo-fused, bicyclic heterocycles represented by partial Formula (1.3.1) are -H, -F, -Cl, -CH₃, -CH₂F, -CHF₂, or -CF₃. Preferably, R^{20} and R^{21} are both -H or -F, in which
 10 case the resulting compounds are characterized by the structure shown in partial Formula (1.0.15) above, or its corresponding difluoro analog (not shown). The substituents R^{23} and R^{24} on the benzo-fused, bicyclic heterocycles represented by the moieties of partial Formulas (1.3.9) through (1.3.13) are each independently -H; -CH₃; -OCH₃; or absent in which case the dashed line ----- represents a double bond. It will be understood, of course, that where
 15 R^{23} and R^{24} are absent; there are no pentavalent carbon atoms in the phenyl portion of said benzo-fused, bicyclic heterocycles. The resulting benzo-fused, bicyclic heterocyclic structures are shown in partial Formulas (1.0.16) through (1.0.18) above.

5.3.1 J^1 Is Other Than Phenyl

In addition to those embodiments of the present invention where J^1 has the preferred
 20 meaning of phenyl, the present invention has also been defined above as being concerned with a compound of Formula (1.0.0) wherein J^1 has the meaning defined above as a moiety comprising a saturated or unsaturated carbon ring system that is 3- to 7-membered monocyclic, or that is 7- to 12-membered, fused or discontinuous, polycyclic; wherein optionally one carbon atom thereof may be replaced by a heteroatom selected from N, O, or
 25 S, and where N is selected, optionally a second carbon atom thereof may be replaced by a heteroatom selected from N, O, or S. The present invention is further concerned with a compound of Formula (1.0.0) wherein J^1 comprises especially a member selected from the group consisting of phenyl; pyrrolyl; pyrrolidinyl; furanyl; thienyl; pyridyl; pyrimidinyl; piperidinyl; piperazinyl; imidazolyl; imidazolidinyl; oxazolyl; isoxazolyl; morpholinyl; thiazolyl; indolyl; quinolinyl; isoquinolinyl; benzimidazolyl; benzoxazolyl; quinuclidinyl; and
 30 azabicyclo[3.3.0]octanyl; a monocyclic -(C₃-C₇) cycloalkyl moiety; a monocyclic -(C₅-C₇) cycloalkenyl moiety that is a member selected from the group consisting of cyclopentenyl, cyclohexenyl, and cycloheptenyl; and a bicyclic -(C₇-C₁₀) cycloalkyl or -(C₇-C₁₀) cycloalkenyl moiety that is a member selected from the group consisting of
 35 norbornanyl, norbornenyl, bicyclo[2.2.2]octanyl, bicyclo[3.2.1]octanyl, bicyclo[3.3.0]octanyl,

bicyclo[2.2.2]oct-5-enyl, bicyclo[2.2.2]oct-7-enyl, bicyclo[3.3.1]nonanyl, cyclodecanyl, and adamantanyl.

5 The present invention is still further concerned especially with a compound of Formula (1.0.0) wherein particularly J^1 and the substituents R^4 , R^5 , and R^6 are selected in such a way that the left-hand terminus of said compound of Formula (1.0.0) is represented by the following partial Formulas (1.8.1) through (1.8.72):

(1.8.49)

(1.8.50)

(1.8.51)

(1.8.52)

(1.8.53)

(1.8.54)

(1.8.55)

(1.8.56)

(1.8.57)

(1.8.58)

(1.8.59)

(1.8.60)

(1.8.61)

(1.8.62)

(1.8.63)

(1.8.64)

(1.8.65)

(1.8.66)

(1.8.67)

(1.8.68)

(1.8.69)

(1.8.70)

(1.8.71)

(1.8.72)

The character of the nicotinamide nucleus with an ether, thioether or sulfonyl linkage to a substituted phenyl group, which forms the left-hand-side of the compound of Formula (1.0.0), has been discussed above. The right-hand-side of the compound of Formula (1.0.0) comprises, in preferred embodiments where J^2 has the preferred meaning of phenyl, a benzyl group which is substituted by substituents R^1 and R^2 . Preferably, only a single substituent, R^1 or R^2 is present, the single substituent R^1 or R^2 is in the 2'-position, and the benzyl group is substituted in the 4-position by the moiety containing the substituents R^A , R^B ,

and **D**. This preferred right-hand-side of the compound of Formula (1.0.0) may be represented by Formula (1.0.4):

(1.0.4)

5.4.0 J^2 Is Phenyl Substituted by R^1 and R^2

The R^1 and R^2 substituents are each a member independently selected from the group consisting of $-H$; $-F$; $-Cl$; (C_1-C_3) alkyl; fluorinated- and/or chlorinated- (C_1-C_3) alkyl; fluorinated- and/or chlorinated- (C_1-C_3) alkoxy; (C_2-C_4) alkynyl; $-CN$; $-NO_2$; $-OR^{16}$; and $-C(=O)NH_2$. Where R^1 and/or R^2 is $-H$ there will be no substituent at any position, especially the 2-position of the phenyl group, attached to the remainder of the left-hand side of the molecule of Formula (1.0.0). Such embodiments are not as preferred as those compounds of the present invention which have a substituent, especially one at the 2-position of the phenyl group. Thus, in some preferred embodiments of the compounds of the present invention, the meaning of R^1 and R^2 is defined as $-H$; $-Cl$; $-F$; chlorinated- and/or fluorinated- (C_1-C_3) alkyl; chlorinated- and/or fluorinated- (C_1-C_3) alkoxy; or (C_2-C_4) alkynyl.

Where a 6-membered carbon ring system is involved, e.g., as in the case of cyclohexyl, phenyl, or pyridyl, it is preferred in particular that such a moiety defining J^2 be attached at its 1- and 4-positions, i.e., that the points of attachment of said moiety be in *para* relationship to each other. However, other configurations of such a 6-membered carbon ring system defining J^2 are within the scope of the compounds of Formula (1.0.0), e.g., where the points of attachment are at the 1- and 2-positions, or at the 1- and 3-positions of said 6-membered carbon ring system.

It is preferred to have a halogen group at the point of the molecule occupied by the R^1 or R^2 substituent, since it usually results in improved performance. It is contemplated to be within the scope of the present invention that R^1 or R^2 is a small lipophilic group comprising $-Cl$ or $-F$; chlorinated- and/or fluorinated- (C_1-C_3) alkyl; or chlorinated- and/or fluorinated- (C_1-C_3) alkoxy. Thus, the meaning of the R^1 or R^2 substituent, as well as of any other substituent of a compound of Formula (1.0.0) that includes the definitions $-Cl$ or $-F$; chlorinated- and/or fluorinated- (C_1-C_3) alkyl; or chlorinated- and/or fluorinated- (C_1-C_3) alkoxy, is selected from the group consisting of the following:

- 88 -

The selectivity of the overall molecule which is achieved by utilizing a moiety of this type as the R¹ and R² substituent may be due to the conformational alignment of the lipophilic moiety with a corresponding lipophilic zone in the PDE4 or PDE4D enzyme substrate, or it may be due to the change in the lipophilicity of the overall molecule which results. Whatever the actual mechanism by which such selectivity is achieved, all such embodiments are contemplated to be within the scope of the present invention.

5.4.1 J² Is Other Than Phenyl

The present invention has also been defined above as being concerned with a compound of Formula (1.0.0) wherein J² has the meaning defined above as a moiety comprising a saturated or unsaturated carbon ring system that is 3- to 7-membered monocyclic, or that is 7- to 12-membered, fused or discontinuous, polycyclic; wherein optionally one carbon atom thereof may be replaced by a heteroatom selected from N, O, or S, and where N is selected, optionally a second carbon atom thereof may be replaced by a heteroatom selected from N, O, or S. The present invention is further concerned with a compound of Formula (1.0.0) wherein J² comprises especially a member selected from the group consisting of phenyl; pyrrolyl; pyrrolidinyl; furanyl; thienyl; pyridyl; pyrimidinyl; piperidinyl; piperazinyl; imidazolyl; imidazolidinyl; oxazolyl; isoxazolyl; thiazolyl; indolyl; quinolinyl; isoquinolinyl; benzimidazolyl; benzoxazolyl; morpholinyl; quinuclidinyl; and azabicyclo[3.3.0]octanyl; a monocyclic -(C₃-C₇) cycloalkyl moiety; a monocyclic -(C₅-C₇) cycloalkenyl moiety that is a member selected from the group consisting of cyclopentenyl, cyclohexenyl, and cycloheptenyl; and a bicyclic -(C₇-C₁₀) cycloalkyl or -(C₇-C₁₀) cycloalkenyl moiety that is a member selected from the group consisting of norbornanyl, norbornenyl, bicyclo[2.2.2]octanyl, bicyclo[3.2.1]octanyl, bicyclo[3.3.0]octanyl, bicyclo[2.2.2]oct-5-enyl, bicyclo[2.2.2]oct-7-enyl, bicyclo[3.3.1]nonanyl, cyclodecanyl, and adamantanyl.

The present invention is also further concerned especially with a compound of Formula (1.0.0) wherein particularly J² and the substituents R¹ and R² are selected in such a way that this portion of the right-hand terminus of said compound of Formula (1.0.0) is represented by the following partial Formulas (3.0.1) through (3.0.47) set out below.

(3.0.1)

5.5 The R^A and R^B Substituents

The group of partial Formula (1.0.4) above is substituted in the 4-position by a moiety containing the substituents D, R^A, and R^B, which may be represented by partial Formula (1.1.8):

(1.1.8)

where m is 1, 2, or 3. In the more preferred embodiments of the compounds of the present invention, m has the meaning of 0 or 1. When m is 1 the moiety $-\text{R}^{\text{A}}-\text{C}-\text{R}^{\text{B}}-$ is present,

- 91 -

and R^A and R^B are preferably each a member independently selected from the group consisting of $-H$ and (C_1-C_4) alkyl; more preferably $-H$ and $-CH_3$.

In other preferred embodiments of the present invention R^A and R^B may be taken together, but only in the case where m is 1, to form a spiro moiety of Formula (1.2.0):

5

(1.2.0)

where r and s are independently 0 to 4 provided that the sum of $r + s$ is at least 1, but not greater than 5; X^A is $-CH_2$, $-CHR^{11}$, or $-C(R^{11})_2$ — where each R^{11} is selected independently of the other and each R^{11} has the same meaning as defined herein; $-NR^{15}$ — where R^{15} has the same meaning as defined herein; $-O-$; or $-S(=O)_t$, where t is 0, 1, or 2; and said spiro moiety is substituted as to any one or more carbon atoms thereof by 0 to 3 substituents R^{14} , as to a nitrogen atom thereof by 0 or 1 substituent R^{15} , and as to a sulfur atom thereof by 0 or 2 oxygen atoms. Accordingly, there results, *inter alia*, the moieties illustrated by partial Formulas (1.2.1) through (1.2.12):

10

15

where t is 0, 1, or 2; and R^{14} and R^{15} have the same meaning as defined herein.

20

Preferred meanings of the R^{14} substituent include $-F$; $-Cl$; $=O$; $-OH$; $-CH_3$; $-OCH_3$; $-C(=O)OH$; $-C(=O)NH_2$; $-NH_2$; $-NHCH(CH_3)_2$; $-NHC(=O)CH_3$; $-NHC(=O)OCH_2CH_3$; $-NHS(=O)_2CH_3$; and $-S(=O)_2NH_2$, resulting in moieties such as those of partial Formulas (3.1.1) through (3.1.34):

- 92 -

5.6 The R^C and R^D Substituents

As already described, R^C and R^D have the same meaning as defined above for R^A and R^B , except that one of them must be $-H$, and they are selected independently of each other and of R^A and R^B . Accordingly, all of the particular and preferred embodiments of the compounds of Formula (1.0.0) detailed above with regard to the R^A and R^B substituents, are for the most part also particular and preferred embodiments of the compounds of Formula (1.0.0) with regard to the R^C and R^D substituents.

5.7 The Moiety $-[N(R^3)]_j-$

The subscript j has the meaning of 0 or 1. Where j has the meaning of 1, which is the preferred meaning, the moiety $-[N(R^3)]_j-$ is present and the compounds of Formula (1.0.0) are essentially nicotinamides in structure with respect to the left-hand side of the core nucleus. The nitrogen atom substituent R^3 is preferably selected from $-H$; $-(C_1-C_3)$ alkyl; and $-(C_1-C_3)$ alkoxy; and is more preferably $-H$; $-CH_3$; or $-OCH_3$. In the most preferred embodiments of the compounds of Formula (1.0.0), R^3 has the meaning of $-H$.

Where J^1 and J^2 both have the preferred meaning of phenyl; and j has the meaning of 0, which is a less preferred meaning than where j is 1, the moiety $-[N(R^3)]_j-$ is absent and the compounds of Formula (1.0.0) are essentially nicotinoyl moieties, *i.e.*, ketones in structure with respect to the left-hand side of the core nucleus. Such a ketone structure in the left-hand side of the core nucleus, together with benzyl as a preferred meaning of the J moiety, is represented by Formula (1.0.7):

(1.0.7)

where all of the substituents and components thereof, i.e., D; W; Y; k, m, and n; R¹, R², R⁴, R⁵, and R⁶; and R^A, R^B, R^C, and R^D; have, for the most part, the same particular and preferred meanings described in detail herein as in the case where j is 1 and the left-hand side of the core nucleus of the compounds is a nicotinamide in structure.

5 5.8 Preferred Subgenus and Species Embodiments of Formula (1.0.0)

In the above description various preferred aspects of the compounds of Formula (1.0.0) have been set forth. As a further demonstration of the scope and the content of the present invention, subgeneric embodiments of the compounds of Formula (1.0.0) are presented. Such preferred embodiments include, but are not limited to, those recited in the following paragraphs (i) through (viii):

(i) A compound according to Formula (1.0.0) wherein where m is 1 or 2, and n is 1; ♦ R^A and R^B are -H, -CF₃, or -(C₁-C₆) alkyl substituted by 0 or 1 of -F, -Cl, -CF₃, -CN, -NH₂, or -C(=O)NH₂, or both taken together are spiro -(C₃-C₆) cycloalkyl- substituted by 0 or 1 of -F, -Cl, -CF₃, or -CN; ♦ one of R^C and R^D is -H, and the other is -H, -(C₁-C₄) alkyl, or phenyl, each substituted by 0 or 1 of -F, -Cl, or -CN; ♦ W¹ is -O- or -S-; ♦ W² is -O-; ♦ Y is =C(R¹_a)— where R¹_a is -H, -F, -Cl, -CN, -CH₃, or -OCH₃; ♦ R¹ and R² are -H, -F, -Cl, -CN, -NO₂, -OH, -CH₃, -OCH₃, -OCHF₂, or -OCF₃; ♦ R³ is -H or -CH₃; ♦ R⁴ is -H, -F, -CN, -NO₂, -OH, -CH₃, or -OCH₃; ♦ J¹ is phenyl; ♦ R⁵ and R⁶ are taken together to form a moiety of partial Formula (1.3.1) where R²⁰ and R²¹ are -H or -CH₃; or a moiety of partial Formula (1.3.11), (1.3.12), or (1.3.15) where R²³ and R²⁴ are absent or are -H, or -CH₃; ♦ J² is phenyl, norbornanyl, furanyl, thienyl, pyrimidinyl, or cyclohexyl; ♦ and D is -C(=O)OR⁷ where R⁷ is -H or -CH₃; -C(=O)NH₂; or tetrazol-5-yl;

(ii) A compound according to paragraph (i) wherein R^A and R^B are both -CH₃, or one is -CH₃ and the other is -CH(CH₃)₂ or -C(CH₃)₃, or one is -H and the other is -CH₃ or -CF₃, or both taken together are spiro cyclopropyl or spiro cyclobutyl; ♦ one of R^C and R^D is -H and the other is -H or -CH₃; W¹ is -O-; ♦ Y is =C(R¹_a)— where R¹_a is -H, -F, or -Cl; ♦ R¹ and R² are -H, -F, or Cl; ♦ R³ is -H; ♦ R⁴ is -H; ♦ R⁵ and R⁶ are taken together to form a moiety of partial Formula (1.3.1) or (1.3.11) where R²³ and R²⁴ are both absent; ♦ J² is phenyl, thienyl, or cyclohexyl; ♦ and D is -C(=O)OR⁷ where R⁷ is -H or -CH₃; -C(=O)NH₂; or tetrazol-5-yl;

(iii) A compound according to paragraph (ii) wherein R^A and R^B are both $-CH_3$, or both taken together are spiro cyclopropyl; ♦ one of R^C and R^D is $-H$ and the other is $-H$ or $-CH_3$; ♦ Y is $=C(R^1_a)-$ where R^1_a is $-H$, $-F$, or $-Cl$; ♦ R^1 and R^2 are $-H$, $-F$, or Cl ; ♦ R^3 is $-H$; ♦ R^4 is $-H$; ♦ R^5 and R^6 are taken together to form a moiety of partial Formula (1.3.11) where R^{23} and R^{24} are both absent; ♦ J^2 is phenyl; ♦ and D is $-C(=O)OR^7$ where R^7 is $-H$ or $-CH_3$; $-C(=O)NH_2$; or tetrazol-5-yl;

(iv) A compound according to paragraph (iii) wherein R^A and R^B are both $-CH_3$; ♦ R^C and R^D are both $-H$; ♦ Y is $=C(R^1_a)-$ where R^1_a is $-H$; ♦ and one of R^1 and R^2 is $-H$ and the other is $-F$;

10 (v) A compound according to paragraph (iii) wherein Y is $=C(R^1_a)-$ where R^1_a is $-F$; ♦ and R^1 and R^2 are both $-H$;

(vi) A compound according to paragraph (ii) wherein R^A and R^B are both $-CH_3$, or both taken together are spiro cyclopropyl; ♦ one of R^C and R^D is $-H$ and the other is $-H$ or $-CH_3$; ♦ Y is $=C(R^1_a)-$ where R^1_a is $-H$, $-F$, or $-Cl$; ♦ R^1 and R^2 are $-H$, $-F$, or Cl ; ♦ R^3 is $-H$; ♦ R^4 is $-H$; ♦ R^5 and R^6 are taken together to form a moiety of partial Formula (1.3.1) where R^{20} and R^{21} are both $-H$; ♦ J^2 is phenyl; ♦ and D is $-C(=O)OR^7$ where R^7 is $-H$ or $-CH_3$; $-C(=O)NH_2$; or tetrazol-5-yl;

(vii) A compound according to paragraph (vi) wherein R^A and R^B are both $-CH_3$; ♦ R^C and R^D are both $-H$; ♦ Y is $=C(R^1_a)-$ where R^1_a is $-H$; ♦ and one of R^1 and R^2 is $-H$ and the other is $-F$; and

(viii) A compound according to paragraph (vii) wherein Y is $=C(R^1_a)-$ where R^1_a is $-F$; ♦ and R^1 and R^2 are both $-H$.

The above description various preferred aspects of the compounds of Formula (1.0.0) have been set forth. As a further demonstration of the scope and the content of the present invention, specific compounds comprising embodiments of the compounds of Formula (1.0.0) are presented. Such species of Formula (1.0.0) include, but are not limited to the following compounds of Formulas (5.5.1) through (5.5.106):

NOMENCLATURE	STRUCTURAL FORMULA
[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluoro-phenoxy]-acetic acid of Formula (5.5.1);	
(±)-2-[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluoro-phenoxy]-propionic acid of Formula (5.5.2);	
(±)-2-[4-([2-(Benzo[2,1,3]oxadiazol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluoro-phenoxy]-propionic acid of Formula (5.5.3);	
(±)-2-[3-Fluoro-4-([2-(4-fluoro-phenoxy)-pyridine-3-carbonyl]-amino)-methyl]-phenoxy]-propionic acid of Formula (5.5.4);	
(±)-2-[3-Fluoro-4-([2-(3-cyano-phenoxy)-pyridine-3-carbonyl]-amino)-methyl]-phenoxy]-propionic acid of Formula (5.5.5);	

<p>(±)-2-[4-({[2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid of Formula (5.5.6);</p>	
<p>(±)-2-[4-({[2-(Benzo[2,1,3]thiadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid of Formula (5.5.7);</p>	
<p>(R)-2-[4-({[2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid of Formula (5.5.8);</p>

5

where R^1 is $-H$ or $-F$; R^A and R^B are $-H$ or (C_1-C_4) alkyl; Q is CH or N ; X is halo; and R^1_a and J^1 have the same meanings as defined above.

DETAILED DESCRIPTION OF THE INVENTION **7.0 Pharmaceutical Salts and Other Forms**

10

The above-described compounds of the present invention may be utilized in the form of acids, esters, or other chemical classes of compounds to which the compounds described belong. It is also within the scope of the present invention to utilize those compounds in the

- 124 -

form of their pharmaceutically acceptable salts derived from various organic and inorganic acids and bases in accordance with procedures well known in the art.

Pharmaceutically acceptable salt forms of the compounds of Formula (1.0.0) are prepared for the most part by conventional means. Where the compound of Formula (1.0.0) contains a carboxylic acid group, a suitable salt thereof may be formed by reacting the compound with an appropriate base to provide the corresponding base addition salt. Examples of such bases are alkali metal hydroxides including potassium hydroxide, sodium hydroxide, and lithium hydroxide; alkaline earth metal hydroxides such as barium hydroxide and calcium hydroxide; alkali metal alkoxides, *e.g.*, potassium ethanolate and sodium propanolate; and various organic bases such as piperidine, diethanolamine, and *N*-methylglutamine. Also included are the aluminum salts of the compounds of Formula (1.0.0).

For certain compounds of Formula (1.0.0) acid addition salts may be formed by treating said compounds with pharmaceutically acceptable organic and inorganic acids, *e.g.*, hydrohalides such as hydrochloride, hydrobromide, hydroiodide; other mineral acids and their corresponding salts such as sulfate, nitrate, phosphate, *etc.*; and alkyl- and monoarylsulfonates such as ethanesulfonate, toluenesulfonate, and benzenesulfonate; and other organic acids and their corresponding salts such as acetate, tartrate, maleate, succinate, citrate, benzoate, salicylate, ascorbate, *etc.*

Accordingly, the pharmaceutically acceptable acid addition salts of the compounds of Formula (1.0.0) include, but are not limited to: acetate, adipate, alginate, arginate, aspartate, benzoate, benzenesulfonate (besylate), bisulfate, bisulfite, bromide, butyrate, camphorate, camphorsulfonate, caprylate, chloride, chlorobenzoate, citrate, cyclopentanepropionate, digluconate, dihydrogenphosphate, dinitrobenzoate, dodecylsulfate, ethanesulfonate, fumarate, galactate (from mucic acid), galacturonate, glucoheptanoate, gluconate, glutamate, glycerophosphate, hemisuccinate, hemisulfate, heptanoate, hexanoate, hippurate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, iodide, isethionate, *iso*-butyrate, lactate, lactobionate, malate, maleate, malonate, mandelate, metaphosphate, methanesulfonate, methylbenzoate, monohydrogenphosphate, 2-naphthalenesulfonate, nicotinate, nitrate, oxalate, oleate, pamoate, pectinate, persulfate, phenylacetate, 3-phenylpropionate, phosphate, phosphonate, phthalate,.

Further, base salts of the compounds of the present invention include, but are not limited to aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic, manganous, potassium, sodium, and zinc salts. Preferred among the above-recited salts are ammonium; the alkali metal salts sodium and potassium; and the alkaline earth metal salts calcium and magnesium. Salts of the compounds of Formula (1.0.0) derived from pharmaceutically acceptable organic non-toxic bases include, but are not limited to salts

- 125 -

of primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, and basic ion exchange resins, e.g., arginine, betaine, caffeine, chlorprocaine, choline, *N,N'*-dibenzylethylenediamine (benzathine), dicyclohexylamine, diethanolamine, diethylamine, 2-diethylaminoethanol, 2-
5 dimethylaminoethanol, ethanolamine, ethylenediamine, *N*-ethylmorpholine, *N*-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, *iso*-propylamine, lidocaine, lysine, meglumine, *N*-methyl-D-glucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethanolamine, triethylamine, trimethylamine, tripropylamine, and tris-(hydroxymethyl)-methylamine (tromethamine).

10 Compounds of the present invention which comprise basic nitrogen-containing groups may be quaternized with such agents as (C₁-C₄) alkyl halides, e.g., methyl, ethyl, *iso*-propyl and *tert*-butyl chlorides, bromides and iodides; di(C₁-C₄) alkyl sulfate, e.g., dimethyl, diethyl and diamyl sulfates; (C₁₀-C₁₈) alkyl halides, e.g., decyl, dodecyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; and aryl-(C₁-C₄) alkyl halides, e.g., benzyl chloride
15 and phenethyl bromide. Such salts permit the preparation of both water-soluble and oil-soluble compounds of the present invention.

Among the above-recited pharmaceutical salts those which are preferred include, but are not limited to acetate, besylate, citrate, fumarate, gluconate, hemisuccinate, hippurate, hydrochloride, hydrobromide, isethionate, mandelate, meglumine, nitrate, oleate,
20 phosphonate, pivalate, sodium phosphate, stearate, sulfate, sulfosalicylate, tartrate, thiomalate, tosylate, and tromethamine.

The acid addition salts of basic compounds of Formula (1.0.0) are prepared by contacting the free base form with a sufficient amount of the desired acid to produce the salt in the conventional manner. The free base may be regenerated by contacting the salt form
25 with a base and isolating the free base in the conventional manner. The free base forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free base forms for purposes of the present invention.

As indicated, the pharmaceutically acceptable base addition salts of the compounds
30 of Formula (1.0.0) are formed with metals or amines, such as alkali metals and alkaline earth metals, or organic amines. Preferred metals are sodium, potassium, magnesium, and calcium. Preferred organic amines are *N,N'*-dibenzylethylenediamine, chlorprocaine, choline, diethanolamine, ethylenediamine, *N*-methyl-D-glucamine, and procaine

The base addition salts of acidic compounds of the present invention are prepared by
35 contacting the free acid form with a sufficient amount of the desired base to produce the salt in the conventional manner. The free acid form may be regenerated by contacting the salt

- 126 -

form with an acid and isolating the free acid form in the conventional manner. The free acid forms differ from their respective salt forms somewhat in physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free acid forms for purposes of the present invention.

5 Multiple salts forms are included within the scope of the present invention where a compound of the present invention contains more than one group capable of forming such pharmaceutically acceptable salts. Examples of typical multiple salt forms include, but are not limited to bitartrate, diacetate, difumarate, dimeglumine, diphosphate, disodium, and trihydrochloride.

10 In light of the above, it can be seen that the expression "pharmaceutically acceptable salt" as used herein is intended to mean an active ingredient comprising a compound of Formula (1.0.0) utilized in the form of a salt thereof, especially where said salt form confers on said active ingredient improved pharmacokinetic properties as compared to the free form of said active ingredient or some other salt form of said active ingredient utilized previously. The
15 pharmaceutically acceptable salt form of said active ingredient may also initially confer a desirable pharmacokinetic property on said active ingredient which it did not previously possess, and may even positively affect the pharmacodynamics of said active ingredient with respect to its therapeutic activity in the body.

The pharmacokinetic properties of said active ingredient which may be favorably
20 affected include, e.g., the manner in which said active ingredient is transported across cell membranes, which in turn may directly and positively affect the absorption, distribution, biotransformation and excretion of said active ingredient. While the route of administration of the pharmaceutical composition is important, and various anatomical, physiological and pathological factors can critically affect bioavailability, the solubility of said active ingredient is
25 usually dependent upon the character of the particular salt form thereof which it utilized. Further, as the artisan will appreciate, an aqueous solution of said active ingredient will provide the most rapid absorption of said active ingredient into the body of a patient being treated, while lipid solutions and suspensions, as well as solid dosage forms, will result in less rapid absorption of said active ingredient.

30 Oral ingestion of an active ingredient of Formula (1.0.0) is the most preferred route of administration for reasons of safety, convenience, and economy, but absorption of such an oral dosage form can be adversely affected by physical characteristics such as polarity, emesis caused by irritation of the gastrointestinal mucosa, destruction by digestive enzymes and low pH, irregular absorption or propulsion in the presence of food or other drugs, and
35 metabolism by enzymes of the mucosa, the intestinal flora, or the liver. Formulation of said active ingredient into different pharmaceutically acceptable salt forms may be effective in

overcoming or alleviating one or more of the above-recited problems encountered with absorption of oral dosage forms.

5 A compound of Formula (1.0.0) prepared in accordance with the methods described herein can be separated from the reaction mixture in which it is finally produced by any ordinary means known to the chemist skilled in the preparation of organic compounds. Once
10 separated said compound can be purified by known methods. Various methods and techniques can be used as the means for separation and purification, and include, e.g., distillation; recrystallization; column chromatography; ion-exchange chromatography; gel chromatography; affinity chromatography; preparative thin-layer chromatography; and solvent extraction.

7.1 Stereoisomers

A compound within the scope of Formula (1.0.0) may be such that its constituent atoms are capable of being arranged in space in two or more different ways, despite having identical connectivities. As a consequence, said compound exists in the form of
15 stereoisomers. *Sys-trans* isomerism is but one type of stereoisomerism. Where the stereoisomers are nonsuperimposable mirror images of each other, they are enantiomers which have chirality or handedness, because of the presence of one or more asymmetric carbon atoms in their constituent structure. Enantiomers are optically active and therefore distinguishable because they rotate the plane of polarized light by equal amounts, but in
20 opposite directions.

Where two or more asymmetric carbon atoms are present in a compound of Formula (1.0.0), there are two possible configurations at each said carbon atom. Where two asymmetric carbon atoms are present, for example, there are four possible stereoisomers. Further, these four possible stereoisomers may be arranged into six possible pairs of
25 stereoisomers that are different from each other. In order for a pair of molecules with more than one asymmetric carbon to be enantiomers, they must have different configurations at every asymmetric carbon. Those pairs that are not related as enantiomers have a different stereochemical relationship referred to as a diastereomeric relationship. Stereoisomers that are not enantiomers are called diastereoisomers, or more commonly, diastereomers.

30 All of these well known aspects of the stereochemistry of the compounds of Formula (1.0.0) are contemplated to be a part of the present invention. Within the scope of the present invention there is thus included compounds of Formula (1.0.0) that are stereoisomers, and where these are enantiomers, the individual enantiomers, racemic mixtures of said enantiomers, and artificial, i.e., manufactured mixtures containing proportions of said
35 enantiomers that are different from the proportions of said enantiomers found in a racemic mixture. Where a compound of Formula (1.0.0) comprises stereoisomers that ar

- 128 -

diastereomers, there is included within the scope of said compound the individual diastereomers as well as mixtures of any two or more of said diastereomers in any proportions thereof.

By way of illustration, in the case where there is a single asymmetric carbon atom in a compound of Formula (1.0.0), resulting in the (-)(R) and (+)(S) enantiomers thereof; there is included within the scope of said compound all pharmaceutically acceptable salt forms, prodrugs and metabolites thereof which are therapeutically active and useful in treating or preventing the diseases and conditions described further herein. Where a compound of Formula (1.0.0) exists in the form of (-)(R) and (+)(S) enantiomers, there is also included within the scope of said compound the (+)(S) enantiomer alone, or the (-)(R) enantiomer alone, in the case where all, substantially all, or a predominant share of the therapeutic activity resides in only one of said enantiomers, and/or unwanted side effects reside in only one of said enantiomers. In the case where there is substantially no difference between the biological activities of both enantiomers, there is further included within the scope of said compound of Formula (1.0.0) the (+)(S) enantiomer and the (-)(R) enantiomer present together as a racemic mixture or as a non-racemic mixture in any ratio of proportionate amounts thereof.

For example, the particular biological activities and/or physical and chemical properties of a pair or set of enantiomers of a compound of Formula (1.0.0) where such exist, may suggest use of said enantiomers in certain ratios to constitute a final therapeutic product. By way of illustration, in the case where there is a pair of enantiomers, they may be employed in ratios such as 90% (R) - 10% (S); 80% (R) - 20% (S); 70% (R) - 30% (S); 60% (R) - 40% (S); 50% (R) - 50% (S); 40% (R) - 60% (S); 30% (R) - 70% (S); 20% (R) - 80% (S); and 10% (R) - 90% (S). After evaluating the properties of the various enantiomers of a compound of Formula (1.0.0) where such exist, the proportionate amount of one or more of said enantiomers with certain desired properties that will constitute the final therapeutic product can be determined in a straightforward manner.

7.2 Isotopes

There is further contemplated to be included within the scope of a compound of Formula (1.0.0) isotopically-labelled forms thereof. An isotopically-labelled form of a compound of Formula (1.0.0) is identical to said compound but for the fact that one or more atoms of said compound have been replaced by an atom or atoms having an atomic mass or mass number different from the atomic mass or mass number of said atom which is usually found in nature. Examples of isotopes which are readily available commercially and which can be incorporated into a compound of Formula (1.0.0) in accordance with well established procedures, include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, sulfur, fluorine and chlorine, e.g., ^2H , ^3H , ^{13}C , ^{14}C , ^{15}N , ^{18}O , ^{17}O , ^{31}P , ^{32}P , ^{35}S , ^{18}F , and ^{36}Cl .

respectively. A compound of Formula (1.0.0), a prodrug thereof, or a pharmaceutically acceptable salt of either which contains one or more of the above-mentioned isotopes and/or other isotopes of other atoms is contemplated to be within the scope of the present invention.

An isotopically-labelled compound of Formula (1.0.0) may be used in a number of beneficial ways. For example, an isotopically-labelled compound of Formula (1.0.0), e.g., one in which a radioactive isotope such as ^3H or ^{14}C has been incorporated, will be useful in drug and/or substrate tissue distribution assays. These radioactive isotopes, i.e., tritium, ^3H , and carbon-14, ^{14}C , are especially preferred for their ease of preparation and eminent detectability. Incorporation of heavier isotopes, e.g., deuterium, ^2H , into a compound of Formula (1.0.0) will provide therapeutic advantages based on the greater metabolic stability of said isotopically-labelled compound. Greater metabolic stability translates directly into increased *in vivo* half-life or reduced dosage requirements, which under most circumstances would constitute a preferred embodiment of the present invention. An isotopically-labelled compound of Formula (1.0.0) can usually be prepared by carrying out the procedures disclosed in the Synthesis Schemes and related description, Examples, and Preparations herein, substituting a readily available isotopically-labelled reagent for its corresponding non-isotopically-labelled reagent.

Deuterium, ^2H , can also be incorporated into a compound of Formula (1.0.0) for the purpose of manipulating the oxidative metabolism of said compound by way of the primary kinetic isotope effect. The primary kinetic isotope effect is a change of rate for a chemical reaction that results from substitution of isotopic nuclei, which in turn is caused by the change in ground state energies required for covalent bond formation subsequent to said isotopic substitution. Substitution of a heavier isotope will usually result in a lowering of the ground state energy for a chemical bond, thereby causing a reduction in rate for a rate-limiting bond breaking step. If the bond-breaking event occurs on or near a saddle-point region along the coordinate of a multi-product reaction, the product distribution ratios can be altered substantially. By way of illustration, when deuterium is bound to a carbon atom at a non-exchangeable site, rate differences of $k_{\text{H}}/k_{\text{D}} = 2-7$ are typical. This difference in rate, applied successfully to an oxidatively labile compound of Formula (1.0.0), can dramatically affect the profile of said compound *in vivo* and result in improved pharmacokinetic properties.

In discovering and developing therapeutic agents, the skilled artisan seeks to optimize pharmacokinetic parameters while retaining desirable *in vitro* properties. It is a reasonable surmise that many compounds with poor pharmacokinetic profiles suffer from a lability to oxidative metabolism. *In vitro* liver microsomal assays now available provide valuable information about the course of this oxidative metabolism, which in turn permits the rational design of deuterated compounds of Formula (1.0.0) with improved stability through

- 130 -

resistance to such oxidative metabolism. Significant improvements in the pharmacokinetic profiles of compounds of Formula (1.0.0) are thereby obtained, and can be expressed quantitatively in terms of increases in *in vivo* half-life ($t/2$), concentration at maximum therapeutic effect (C_{max}), area under the dose response curve (AUC), and F; and in terms of decreases in clearance, dose, and cost-of-goods.

By way of illustration of the above, a compound of Formula (1.0.0) which has multiple potential sites for oxidative metabolism, e.g., benzylic hydrogen atoms and hydrogen atoms α to a nitrogen atom, is prepared as a series of analogs in which various combinations of hydrogen atoms are replaced by deuterium atoms so that some, most or all of said hydrogen atoms are replaced with deuterium atoms. Half-life determinations provide an expedient and accurate determination of the extent of improvement in resistance to oxidative metabolism. In this manner it is determined that the half-life of the parent compound can be extended by as much as 100% as the result of such deuterium-for-hydrogen substitution.

Deuterium-for-hydrogen substitution in a compound of Formula (1.0.0) can also be used to achieve a favorable alteration in the metabolite profile of the parent compound as a way of diminishing or eliminating unwanted toxic metabolites. For example, where a toxic metabolite arises through an oxidative carbon-hydrogen, C-H, bond scission, the deuterated analog is reasonably expected to greatly diminish or eliminate production of the unwanted metabolite, even in the case where the particular oxidation is not a rate-determining step.

Further information concerning the state of the art with respect to deuterium-for-hydrogen substitution may be found, e.g., in Hanzlik *et al.*, *J. Org. Chem.* 55 3992-3997, 1990; Reider *et al.*, *J. Org. Chem.* 52 3326-3334, 1987; Foster, *Adv. Drug Res.* 14 1-40, 1985; Gillette *et al.*, *Biochemistry* 33(10) 2927-2937, 1994; and Jarman *et al.*, *Carcinogenesis* 16(4) 683-688, 1993.

DETAILED DESCRIPTION OF THE INVENTION

8.0 Therapeutic Applications and Clinical Endpoints

The description which follows concerns the therapeutic applications to which the compounds of Formula (1.0.0) may be put, and where applicable an explanation of the clinical endpoints associated with such therapeutic applications. There is also set forth a disclosure of various *in vitro* assays and animal model experiments, which are capable of providing data sufficient to define and demonstrate the therapeutic utility of the compounds of Formula (1.0.0).

The therapeutic utility of the compounds of Formula (1.0.0) is applicable to a patient or subject afflicted with a disease or condition as herein set forth and therefore in need of such treatment. The beneficial results are therapeutic whether administered to animals or

- 131 -

humans. As used herein the terms "animal" and "animals" is used merely for the purpose of pointing out human beings as opposed to other members of the animal kingdom. The compounds of Formula (1.0.0) have therapeutic applicability in the treatment of mammals, and in particular of humans. All of the major subdivisions of the class of mammals
5 (Mammalia) are included within the scope of the present invention with regard to being recipients of therapeutic treatment as described herein. Mammals have value as pets to humans and are therefore likely to be subjects of treatment. This applies especially to the canine and feline groups of mammals. Other mammals are valued as domesticated animals and their treatment in accordance with the present invention is likely in view of the adverse
10 economic impact of not treating the diseases and conditions described herein. This applies especially to the equine, bovine, porcine, and ovine groups of mammals.

The compounds of Formula (1.0.0) inhibit the PDE4 isozyme and thereby have a wide range of therapeutic applications, as described further below, because of the essential role which the PDE4 family of isozymes plays in the physiology of all mammals. The
15 enzymatic role performed by the PDE4 isozymes is the intracellular hydrolysis of adenosine 3',5'-monophosphate (cAMP) within pro-inflammatory leukocytes. cAMP, in turn, is responsible for mediating the effects of numerous hormones in the body, and as a consequence, PDE4 inhibition plays a significant role in a variety of physiological processes. There is extensive literature in the art describing the effects of PDE inhibitors on various
20 inflammatory cell responses, which in addition to cAMP elevation, include inhibition of superoxide production, degranulation, chemotaxis and tumor necrosis factor (TNF) release in eosinophils, neutrophils and monocytes.

PDE4 was first identified in 1985, Nemoz *et al. Biochem. Pharmacol.* **34** 2997-3000, 1985, and the PDE4 inhibitors rolipram and denbufylline were studied early on in clinical trials
25 for CNS indications such as depression. Subsequently, it was established that PDE4 is the principal phosphodiesterase in inflammatory leukocytes. The four subtypes of PDE4, *i.e.*, PDE4A, PDE4B, PDE4C, and PDE4D, are widely distributed in human tissues, as determined by the presence of their mRNAs. PDE4D is expressed in kidney, thymus, small intestine, and colon tissues, and is strongly expressed in brain, lung, skeletal muscle, prostate, and
30 peripheral blood leukocyte (PBL) tissues. It is only weakly expressed in heart, placenta, liver, pancreas, spleen, testes, and ovary tissues. PDE4A and PDE4B are also strongly expressed in brain and skeletal muscle tissues, and only weakly expressed in placenta, liver, and ovary tissues. PDE4C is strongly expressed in skeletal muscle tissue as well, and is also weakly expressed in ovary tissue. PDE4C is usually not detectable in the majority of the above-
35 mentioned tissues.

- 132 -

The PDE4 family of isozymes is the predominant form of phosphodiesterase found in cell types implicated in chronic inflammatory diseases, and among bone-marrow derived cell types, only platelets do not express PDE. PDE4 is the major cAMP-metabolizing enzyme in immune and inflammatory cells, and is one of two major cAMP-metabolizing enzymes in airway smooth muscle. PDE4 is exclusively present in neutrophils, eosinophils, basophils, and monocytes, while in macrophages PDE3 and PDE1 activity, and in T lymphocytes PDE7 activity has also been demonstrated. The beneficial anti-inflammatory effects of inhibitors of PDE have been demonstrated heretofore using *in vitro* experiments, which have established that such compounds inhibit superoxide generation in human monocytes, eosinophils, and neutrophils; mediator release in basophils, macrophages, and neutrophils; and TNF α release in monocytes and macrophages. PDE inhibitors also inhibit mediator release of inflammatory cells like monocytes and monocyte-derived macrophages, lung mast cells, T lymphocytes, B lymphocytes, alveolar macrophages, and eosinophils.

Beneficial anti-inflammatory effects have also been observed *in vivo* heretofore, including inhibition of microvascular leakage into the lungs of sensitized guinea pigs, and reduction of bronchial hyper-reactivity and eosinophilia in cynomolgus monkeys following repeated antigen challenge. It has also been demonstrated heretofore that PDE4 inhibitors potently suppress TNF α release from mononuclear phagocytes.

8.1 Asthma

One of the most important respiratory diseases treatable with PDE4, especially PDE4D inhibitors of the type within the scope of the compounds of Formula (1.0.0) is asthma, a chronic, increasingly common disorder encountered worldwide and characterized by intermittent reversible airway obstruction, airway hyper-responsiveness and inflammation. The cause of asthma has yet to be determined, but the most common pathological expression of asthma is inflammation of the airways, which may be significant even in the airways of patients with mild asthma. Based on bronchial biopsy and lavage studies it has been clearly shown that asthma involves infiltration by mast cells, eosinophils, and T-lymphocytes into a patient's airways. Bronchoalveolar lavage (BAL) in atopic asthmatics shows activation of interleukin (IL)-3, IL-4, IL-5 and granulocyte/macrophage-colony stimulating factor (GM-CSF) that suggests the presence of a T-helper 2 (Th-2)-like T-cell population.

Compounds of Formula (1.0.0) inhibit PDE4 in human eosinophils and are therefore useful in the treatment of atopic and non-atopic asthma. The term "atopy" refers to a genetic predisposition toward the development of type I (immediate) hypersensitivity reactions against common environmental antigens. The most common clinical manifestation is allergic rhinitis, while bronchial asthma, atopic dermatitis, and food allergy occur less frequently. Accordingly, the expression "atopic asthma" as used herein is intended to be synonymous with "allergic asthma", i.e., bronchial asthma which is an allergic manifestation in a sensitized person. The

- 133 -

term "non-atopic asthma" as used herein is intended to refer to all other asthmas, especially essential or "true" asthma, which is provoked by a variety of factors, including vigorous exercise, irritant particles, psychologic stresses, etc.

- 5 The use of the compounds of Formula (1.0.0) to treat atopic asthma or non-atopic asthma is established and demonstrated by the models of PDE inhibition, inhibition of eosinophil activation, and the cell infiltration models described below.

Pulmonary Inflammation in Allergic Cynomolgus Monkeys -- The ability of the combinations of therapeutic agents of the present invention to inhibit *Ascaris* antigen induced increases in the inflammatory cell content of bronchial alveolar lavage fluid from cynomolgus monkey subjects is evaluated in this method. Using a cross-over design, 8-10 *Ascaris*-sensitive cynomolgus monkeys are treated with vehicle or drug. At appropriate pretreatment time, each monkey is anesthetized (ketamine 10 m/kg + xylazine 1 mg/kg, I.m.) and intubated with a cuffed endotracheal tube. Bronchoalveolar lavage (BAL) is performed using one 15 ml wash of phosphate buffered saline (PBS) delivered through a pediatric fiberoptic bronchoscope inserted through the endotracheal tube and wedged into a third to fifth generation bronchus. Lavage fluid is gently aspirated and collected in a syringe. After BAL is complete, each animal receives a 2 min exposure to a concentration of *Ascaris suum* aerosol which doubles respiratory system resistance determined in previous experiments. Each monkey is returned to its cage and 24 hr later a second lavage is performed, using 15 ml PBS, on the opposite side of the lung. One week after the first trial, control and treated monkeys are reversed and the experiment repeated. To determine the percent composition of each leukocyte type, two slides from each monkey BAL sample is obtained by centrifuging 2 x 150 ul lavage fluid for 2 min @ 500 rpm in Cytospin centrifuge. Slides are stained in Diff-Quick for differential cell count and cells identified by standard morphological criteria. Total leukocyte numbers per milliliter of BAL fluid are determined by diluting 20 ul of sample in 20 ml Isoton, adding 3 drops of Zapoglobin to lyse erythrocytes and reading the sample using a Coulter Counter. Comparisons are made between the ratio of increase in bronchial alveolar lavage eosinophil, cytokine or mediator levels, pre-antigen challenge versus 24 hours post antigen challenge, with and without drug treatment.

- 30 In the above test model the combinations of therapeutic agents of the present invention exhibit anti-inflammatory activity at dosages in the range of from 0.001 to 0.1 mg/kg i.v. or 0.01 to 10.0 mg/kg p.o. or 0.001 to 0.1 mg/kg i.t.

Another useful assay, based on the use of primates, is that described in Turner *et al.*, "Characterization of a primate model of asthma using anti-allergy/anti-asthma agents," *Inflammation Research* 45 239-245, 1996.

35

- 134 -

Anti-inflammatory Activity – The anti-inflammatory activity of the combinations of therapeutic agents of the present invention is demonstrated by the inhibition of eosinophil activation as measured by sephadex bead stimulated LTE4 production in whole human blood. Whole Blood Assay for LTE4 using Sephadex Beads as Stimulant. On the day before the

5 assay, siliconize glass tubes with Sigmacote (Sigma, Cat# SL-2). Before Drawing the blood, dilute compounds in DMSO 1000X, add 1µl of either DMSO or compound to each respective tube, and place rack of tubes in 37°C water bath. Have Blood drawn into heparinized Vacutainer tube #6480 (143USP units sodium heparin, 10ml), 10 tubes =100ml blood. Pool Blood tubes in two 50 ml conical tubes. Add 1 ml of whole blood to each siliconized tube

10 containing DMSO or compound VORTEX and then incubate at 37°C for 15 minutes. To prepare the Sephadex G-15 beads (Pharmacia, Cat# 17-0020-01) suspension, add 3.3 g. of Sephadex G-15, mix with 20 mls of PBS in a 100 ml beaker then mix with a magnetic stir bar. After 15 minutes, add 100µl of Sephadex G-15 beads to each tube except the Sephadex tubes which will provide the baseline value for LTE4 release. Vortex and incubate for 90

15 minutes at 37°C. At the end of 90 minutes incubation, add 20µl of 15% EDTA, VORTEX and centrifuge for 5 minutes at 1000 rpm. Then remove and save the plasma sample for analysis. LTE4 levels are determined by Cayman's Cysteinyl-LT ELISA kit (Cat # 520501). Percent inhibition is calculated as $100 \times 1 - (\text{LTE4 concentration in the drug treated sample} / \text{LTE4 concentration in the non-drug treated control samples})$.

20 Compounds of Formula (1.0.0) are active in the above test method at concentrations in the range of from 0.0001µM to 20.0 µM, with preferred embodiments being active at concentrations in the range of from 0.5 nM to 1000 nM.

From the above it may be seen that compounds of Formula (1.0.0) are useful for the treatment of inflammatory or obstructive airways diseases or other conditions involving

25 airways obstruction. In particular they are useful for the treatment of bronchial asthma.

In view of their anti-inflammatory activity, their influence on airways hyper-reactivity, and their profile in relation to PDE isoenzyme inhibition, in particular as selective PDE4 Inhibitors, the compounds of Formula (1.0.0) are useful for the treatment, in particular prophylactic treatment, of obstructive or inflammatory airways diseases. Thus, by continued

30 and regular administration over prolonged periods of time the compounds of Formula (1.0.0) are useful in providing advance protection against the recurrence of bronchoconstriction or other symptomatic attack consequential to obstructive or inflammatory airways diseases. The compounds of Formula (1.0.0) are also useful for the control, amelioration or reversal of the basal status of such diseases.

- 135 -

Having regard to their bronchodilator activity the compounds of Formula (1.0.0) are useful as bronchodilators, e.g., in the treatment of chronic or acute bronchoconstriction, and for the symptomatic treatment of obstructive or inflammatory airways diseases.

5 The words "treatment" and "treating" as used throughout the present specification and claims in relation to obstructive or inflammatory airways diseases are to be understood, accordingly, as embracing both prophylactic and symptomatic modes of therapy.

10 In light of the above description, it may be seen that the present invention also relates to a method for the treatment of airways hyper-reactivity in mammals; to a method of effecting bronchodilation in mammals; and in particular, to a method of treating obstructive or inflammatory airways diseases, especially asthma, in a mammal subject in need thereof, which method comprises administering to said subject mammal an effective amount of a compound of Formula (1.0.0).

15 Obstructive or inflammatory airways diseases to which the present invention applies include asthma; pneumoconiosis; chronic eosinophilic pneumonia; chronic obstructive airways or pulmonary disease (COAD or COPD); and adult respiratory distress syndrome (ARDS), as well as exacerbation of airways hyper-reactivity consequent to other drug therapy, e.g., aspirin or β -agonist therapy.

20 The compounds of Formula (1.0.0) are useful in the treatment of asthma of whatever type, etiology, or pathogenesis; including intrinsic asthma attributed to pathophysiologic disturbances, extrinsic asthma caused by some factor in the environment, and essential asthma of unknown or inapparent cause. The compounds of Formula (1.0.0) are useful in the treatment of allergic (atopic/bronchial/IgE-mediated) asthma; and they are useful as well in the treatment of non-atopic asthma, including e.g. bronchitic, emphysematous, exercise-induced, and occupational asthma; infective asthma that is a sequela to microbial, especially
25 bacterial, fungal, protozoal, or viral infection; and other non-allergic asthmas, e.g., incipient asthma (wheezy infant syndrome).

30 The compounds of Formula (1.0.0) are further useful in the treatment of pneumoconiosis of whatever type, etiology, or pathogenesis; including, e.g., aluminosis (bauxite workers' disease); anthracosis (miners' asthma); asbestosis (steam-filters' asthma); chalicosis (flint disease); pttilosis caused by inhaling the dust from ostrich feathers; siderosis caused by the inhalation of iron particles; silicosis (grinders' disease); byssinosis (cotton-dust asthma); and talc pneumoconiosis.

8.2 Chronic Obstructive Pulmonary Disease (COPD)

35 The compounds of Formula (1.0.0) are still further useful in the treatment of COPD or COAD including chronic bronchitis, pulmonary emphysema or dyspnea associated therewith. COPD is characterized by irreversible, progressive airways obstruction. Chronic bronchitis is

- 136 -

associated with hyperplasia and hypertrophy of the mucus secreting glands of the submucosa in the large cartilaginous airways. Goblet cell hyperplasia, mucosal and submucosal inflammatory cell infiltration, edema, fibrosis, mucus plugs and increased smooth muscle are all found in the terminal and respiratory bronchioles. The small airways are known to be a major site of airway obstruction. Emphysema is characterized by destruction of the alveolar wall and loss of lung elasticity. A number of risk factors have also been identified as linked to the incidence of COPD. The link between tobacco smoking and COPD is well established. Other risk factors include exposure to coal dust and various genetic factors. See Sandford *et al.*, "Genetic risk factors for chronic obstructive pulmonary disease," *Eur. Respir. J.* **10** 1380-1391, 1997. The incidence of COPD is increasing and it represents a significant economic burden on the populations of the industrialized nations. COPD also presents itself clinically with a wide range of variation from simple chronic bronchitis without disability to patients in a severely disabled state with chronic respiratory failure.

COPD is characterized by inflammation of the airways, as is the case with asthma, but the inflammatory cells that have been found in the bronchoalveolar lavage fluid and sputum of patients neutrophils rather than eosinophils. Elevated levels of inflammatory mediators are also found in COPD patients, including IL-8, LTB₄, and TNF- α , and the surface epithelium and sub-epithelium of the bronchi of such patients has been found to be infiltrated by T-lymphocytes and macrophages. Symptomatic relief for COPD patients can be provided by the use of β -agonist and anticholinergic bronchodilators, but the progress of the disease remains unaltered. COPD has been treated using theophylline, but without much success, even though it reduces neutrophil counts in the sputum of COPD patients. Steroids have also failed to hold out much promise as satisfactory treatment agents in COPD.

Accordingly, the use of the compounds of Formula (1.0.0) to treat COPD and its related and included obstructed airways diseases, represents a significant advance in the art. The present invention is not limited to any particular mode of action or any hypothesis as to the way in which the desired therapeutic objectives have been obtained by utilizing the compounds of Formula (1.0.0). However, it is recognized in the art that PDE4 is the predominant PDE in neutrophils and macrophages; Cheng *et al.*, "Synthesis and *in vitro* profile of a novel series of catechol benzimidazoles. The discovery of potent, selective phosphodiesterase Type IV inhibitors with greatly attenuated affinity for the [3H]rolipram binding site," *Bioorg. Med. Chem. Lett.* **5** 1969-1972, 1995; Wright *et al.* "Differential inhibition of human neutrophil functions: role of cyclic AMP-specific, cyclic GMP-insensitive phosphodiesterase," *Biochem. Pharmacol.* **40** 699-707, 1990; Schudt *et al.*, "Influence of selective phosphodiesterase inhibitors on human neutrophil functions and levels of cAMP and Cai," *Naunyn Schmiedebergs Arch. Pharmacol.* **344** 682-690, 1991; and Tenor *et al.*, "Cyclic

nucleotide phosphodiesterase isoenzyme activities in human alveolar macrophages," *Clin. Exp. Allergy* 25 625-633, 1995.

In order to provide a better understanding of the present invention, the inference is made here that the compounds of Formula (1.0.0) inhibit PDE4s in neutrophils, resulting in reduced chemotaxis, activation, adherence, and degranulation; Schudt *et al.*, *Ibid.*; Nelson *et al.*, "Effect of selective phosphodiesterase inhibitors on the polymorphonuclear leukocyte respiratory burst," *J. Allergy Clin. Immunol.* 86 801-808, 1990; and Bloeman *et al.*, "Increased cAMP levels in stimulated neutrophils inhibit their adhesion to human bronchial epithelial cells," *Am. J. Physiol.* 272 L580-587, 1997.

10 It is also inferred that the compounds of Formula (1.0.0) reduce superoxide anion production mediated by PDE4s in peripheral blood neutrophils, and that they regulate leukotriene synthesis mediated by PDE4s; Wright *et al.*, *Ibid.*; Schudt *et al.*, *Ibid.*; Bloeman *et al.*, *Ibid.*; Al Essa, *et al.*, "Heterogeneity of circulating and exudated polymorphonuclear leukocytes in superoxide-generating response to cyclic AMP and cyclic AMP-elevating agents: investigation of the underlying mechanism," *Biochem. Pharmacol.* 49 315-322, 1995; 15 Ottonello *et al.*, "Cyclic AMP-elevating agents down-regulate the oxidative burst induced by granulocyte-macrophage colony stimulating factor (GM-CSF) in adherent neutrophils," *Clin. Exp. Immunol.* 101 502-506, 1995; and Ottonello *et al.*, "Tumor necrosis factor alpha-induced oxidative burst in neutrophils adherent to fibronectin: effects of cyclic AMP-elevating agents," 20 *Br. J. Haematol.* 91 566-570, 1995.

It is further inferred that the compounds of Formula (1.0.0) inhibit CD11b/CD18 expression; Berends *et al.*, "Inhibition of PAF-induced expression of CD11b and shedding of L-selectin on human neutrophils and eosinophils by the type-IV selective PDE inhibitor, rolipram," *Eur. Respir. J.* 10 1000-1007, 1997; and Derlan *et al.*, "Inhibition of chemotactic peptide-induced neutrophil adhesion to vascular endothelium by cAMP modulators," *J. Immunol.* 154 308-317, 1995. 25

It is still further inferred that the compounds of Formula (1.0.0) inhibit alveolar macrophage PDE4s, thereby reducing the release of chemotactic factors and TNF- α ; and that the compounds of Formula (1.0.0) increase synthesis and facilitate release from monocytes of the anti-inflammatory cytokine IL-10, which in turn is capable of decreasing the generation of TNF- α , IL-1 β , and GM-CSF by synovial fluid mononuclear cells, thereby augmenting the overall anti-inflammatory profile of the PDE4 inhibitors of Formula (1.0.0); Schudt *et al.*, "PDE isoenzymes as targets for anti-asthma drugs," *Eur. Respir. J.* 8 1179-1183, 1995; and Kambayashi *et al.*, "Cyclic nucleotide phosphodiesterase Type IV participates in the regulation of IL-10 and the subsequent inhibition of TNF-alpha and IL-6 release by endotoxin-stimulated macrophages," *J. Immunol.* 155 4909-4916, 1995. 30 35

- 138 -

The application of PDE4 inhibitors to the treatment of COPD in human patients has been demonstrated in clinical trials. Treatment with SB-207,499, represented by Formula (0.1.9) above, at a dose of 15 mg twice a day for six weeks has been shown to result in increases in FEV₁ and forced vital capacity (FVC); Brown, W.M., "SB-207499," *Anti-inflamm. Immunomodulatory Invest. Drugs* 1 39-47, 1999. The clinical efficacy of SB-207,499 has also been demonstrated in a four week trial that has provided evidence of improved FEV₁; and in a six week study in COPD patients receiving 15 mg twice a day that has also provided evidence of improved FEV₁; Brown, *Ibid.* SB-207,499 has already been described further above and represented by Formula (0.1.9):

SB-207,499

(0.1.9)

8.3 Bronchitis and Bronchiectasis

In accordance with the particular and diverse inhibitory activities described above that are possessed by the compounds of Formula (1.0.0), they are useful in the treatment of bronchitis of whatever type, etiology, or pathogenesis, including, e.g., acute bronchitis which has a short but severe course and is caused by exposure to cold, breathing of irritant substances, or an acute infection; acute laryngotracheal bronchitis which is a form of nondiphtheritic croup; arachidic bronchitis which is caused by the presence of a peanut kernel in a bronchus; catarrhal bronchitis which is a form of acute bronchitis with a profuse mucopurulent discharge; chronic bronchitis which is a long-continued form of bronchitis with a more or less marked tendency to recurrence after stages of quiescence, due to repeated attacks of acute bronchitis or chronic general diseases, characterized by attacks of coughing, by expectoration either scanty or profuse, and by secondary changes in the lung tissue; croupus bronchitis which is characterized by violent cough and paroxysms of dyspnea; dry bronchitis which is characterized by a scanty secretion of tough sputum; infectious asthmatic bronchitis which is a syndrome marked by the development of symptoms of bronchospasm following respiratory tract infections in persons with asthma; productive bronchitis which is bronchitis associated with a productive cough; staphylococcus or streptococcal bronchitis which are caused by staphylococci or streptococci; and vesicular bronchitis in which the inflammation extends into the alveoli, which are sometimes visible under the pleura as whitish-yellow granulations like millet seeds.

- 139 -

Bronchiectasis is a chronic dilatation of the bronchi marked by fetid breath and paroxysmal coughing with the expectoration of mucopurulent matter. It may affect the tube uniformly, in which case it is referred to as cylindric bronchiectasis, or it may occur in irregular pockets, in which case it is called sacculated bronchiectasis. When the dilated bronchial tubes have terminal bulbous enlargements, the term fusiform bronchiectasis is used. In those cases where the condition of dilatation extends to the bronchioles, it is referred to as capillary bronchiectasis. If the dilatation of the bronchi is spherical in shape, the condition is referred to as cystic bronchiectasis. Dry bronchiectasis occurs where the infection involved is episodic and it may be accompanied by hemoptysis, the expectoration of blood or of blood-stained sputum. During quiescent periods of dry bronchiectasis, the coughing which occurs is nonproductive. Follicular bronchiectasis is a type of bronchiectasis in which the lymphoid tissue in the affected regions becomes greatly enlarged, and by projection into the bronchial lumen, may seriously distort and partially obstruct the bronchus. Accordingly, the compounds of Formula (1.0.0) are useful in the beneficial treatment of the various above-described types of bronchiectasis as a direct result of their inhibition of PDE4 isozymes.

The utility of the compounds of Formula (1.0.0) as bronchodilators or bronchospasmolytic agents for treating bronchial asthma, chronic bronchitis and related diseases and disorder described herein, is demonstrable through the use of a number of different *in vivo* animal models known in the art, including those described in the paragraphs below..

Bronchospasmolytic Activity *In Vitro* – The ability of the compounds of Formula (1.0.0) to cause relaxation of guinea-pig tracheal smooth muscle is demonstrated in the following test procedure. Guinea-pigs (350-500 g) are killed with sodium pentothal (100 mg/kg i.p.). The trachea is dissected and a section 2-3 cm in length is excised. The trachea is transected in the transverse plane at alternate cartilage plates so as to give rings of tissue 3-5 mm in depth. The proximal and distal rings are discarded. Individual rings are mounted vertically on stainless steel supports, one of which is fixed at the base of an organ bath, while the other is attached to an isometric transducer. The rings are bathed in Krebs solution (composition μ M: NaHCO_3 25; NaCl 113; KCl 4.7; $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ 1.2; KH_2PO_4 1.2; CaCl_2 2.5; glucose 11.7) at 37°C and gassed with O_2/CO_2 (95:5, v/v). Rings prepared in this manner, preloaded to 1 g, generate spontaneous tone and, after a period of equilibration (45-60m), relax consistently on addition of spasmolytic drugs. To ascertain spasmolytic activity, test compounds of Formula (1.0.0) are dissolved in physiological saline and added in increasing quantities to the organ bath at 5m intervals to provide a cumulative concentration-effect curve.

- 140 -

In the above test model, compounds of Formula (1.0.0) produce concentration-related relaxation of guinea-pig tracheal ring preparations at concentrations in the range of from 0.001 to 1.0 μ M.

The anti-inflammatory activity of the combinations of therapeutic agents of the present invention is demonstrated by the inhibition of $\text{TNF}\alpha$ production in human whole blood stimulated with Lipopolysaccharide (LPS). Compounds are analyzed in the presence of beta agonist (10 ng/ml) and Indomethacin (1 μ M). Prepare 250 ml assay buffer 200 mM HEPES in RPMI 1640 filtered. The following are performed at room temperature at the bench. Prepare "IP" cocktail in 50 ml polypropylene tube by adding 0.4 ml of Indomethacin (stock 4 mM) and 0.4 ml of beta agonist (stock 0.04 mg/ml) for f.v. 40ml with assay buffer. Prepare compounds from powder stocks into DMSO to either 200 or 60 mM stock solutions. Make eight-point half-log serial dilutions in glass vials or microtubes. Add 0.01 ml of each compound dilution to the 5 ml polypropylene tubes where 0.490 ml assay buffer and 0.50 ml "IP" cocktail is added for f.v. 1.0 ml. (The compounds' assay f.c. 100-0.1 μ M.) Prepare LPS solution such that 0.08 ml LPS (stock 1 mg/ml) is added to 40 ml assay buffer for f.c. 2 ug/ml. 6. Prepare a 2% DMSO solution by adding 200 μ l DMSO to 9.8 ml assay buffer. Add 10 ml of IP cocktail to the 2% DMSO solution. This cocktail is used for control wells such that Indomethacin assay f.c. is 1 μ M and beta agonist f.c. is 10 ng/ml. The following are performed under the tissue culture hood. Add 0.0125 ml of diluted compound to appropriate well in U-bottom sterile Costar 96-well plate #3790. Add 0.0125 ml LPS to all wells (f.c. 0.1 ug/ml) except negative control wells. Fresh human whole blood is drawn (~22 ml per 96-well plate) usually four green tops per donor into sterile heparin tubes kept at 37 $^{\circ}$ C. Add 0.225 ml of whole blood to the plates. Cover, incubate at 37 $^{\circ}$ C, and rock for four hours. Centrifuge the plates at 2000rpm for 10 minutes. Prepare ELISA standards. Remove 100 μ l serum into flat bottom plate. Dilute 1:20 by removing 15 μ l and adding 285 μ l RD6 diluent. Freeze @ -20 $^{\circ}$ C. For analysis, thaw and add 200 μ l to R & D Systems $\text{TNF}\alpha$ ELISA. Process the plates according to R & D Systems protocol. Read plate at 450 nm using SoftMax Pro. Analyze and interpret with Java Fitter in order to determine IC50 values. A dose response curve of data expressed as percent control is plotted. A minimum of six triplicate points are generated for each compound. The IC50 values are calculated using the Java Fitter curve-fitting program under the "IC50 fix both " parameter.

In the above test model, combinations of therapeutic agents of the present invention produce concentration-related inhibition of $\text{TNF}\alpha$ production at concentrations in the range of from 0.001 to 1.0 μ M.

35 **8.4 Allergic and Other Types of Rhinitis; Sinusitis**

Allergic rhinitis is characterized by nasal obstruction, itching, watery rhinorrhea,

- 141 -

sneezing and occasional anosmia. Allergic rhinitis is divided into two disease categories, seasonal and perennial, in which the former is attributed to pollen or outdoor mould spores, while the latter is attributed to common allergens such as house dust mites, animal danders, and mould spores. Allergic rhinitis generally exhibits an early phase response and a late phase response. The early phase response is associated with mast cell degranulation, while the late phase response is characterized by infiltration of eosinophils, basophils, monocytes, and T-lymphocytes. A variety of inflammatory mediators is also released by these cells, all of which may contribute to the inflammation exhibited in the late phase response.

A particularly prevalent form of seasonal allergic rhinitis is hay fever, which is marked by acute conjunctivitis with lacrimation and itching, swelling of the nasal mucosa, nasal catarrh, sudden attacks of sneezing, and often with asthmatic symptoms. The compounds of Formula (1.0.0) are especially useful in the beneficial treatment of hay fever.

Other types of rhinitis for which the compounds of Formula (1.0.0) may be used as therapeutic agents include acute catarrhal rhinitis which is a cold in the head involving acute congestion of the mucous membrane of the nose, marked by dryness and followed by increased mucous secretion from the membrane, impeded respiration through the nose, and some pain; atrophic rhinitis which is a chronic form marked by wasting of the mucous membrane and the glands; purulent rhinitis which is chronic rhinitis with the formation of pus; and vasomotor rhinitis which is a non-allergic rhinitis in which transient changes in vascular tone and permeability with the same symptoms as allergic rhinitis, are brought on by such stimuli as mild chilling, fatigue, anger, and anxiety.

There is a recognized link between allergic rhinitis and asthma. Allergic rhinitis is a frequent accompaniment to asthma, and it has been demonstrated that treating allergic rhinitis will improve asthma. Epidemiologic data has also been used to show a link between severe rhinitis and more severe asthma. For example, the compound D-22888, under preclinical development for the treatment of allergic rhinitis, has been shown to exhibit a strong anti-allergic effect and to inhibit rhinorrhea in the antigen-challenged pig. See, Marx *et al* "D-22888 - a new PDE4 inhibitor for the treatment of allergic rhinitis and other allergic disorders," *J. Allergy Clin. Immunol* 99 S444, 1997. Another experimental compound, AWD-12,281 has been shown to be active in a rat model of allergic rhinitis. See Poppe *et al* "Effect of AWD 12-281, a new selective PDE-4 inhibitor, loteprednol and beclomethasone in models of allergic rhinitis and airway inflammation in brown norway-rats," *Am. J. Respir. Crit. Care Med.* A95, 1999. The compounds D-22888 and AWD-12,281 have already been described further above and represented by Formulas (0.0.28) and (0.0.34), respectively:

- 142 -

D-22888

(0.0.28)

Loteprednol (AWD - 12,281)

(0.0.34)

Sinusitis is related to rhinitis in terms of anatomical proximity as well as a shared etiology and pathogenesis in some cases. Sinusitis is the inflammation of a sinus and this condition may be purulent or nonpurulent, as well as acute or chronic. Depending upon the sinus where the inflammation is located, the condition is known as ethmoid, frontal, maxillary, or sphenoid sinusitis. The ethmoidal sinus is one type of paranasal sinus, located in the ethmoid bone. The frontal sinus is one of the paired paranasal sinuses located in the frontal bone. The maxillary sinus is one of the paired paranasal sinuses located in the body of the maxilla. Accordingly, the compounds of Formula (1.0.0) are useful in the beneficial treatment of acute or chronic sinusitis, but especially of chronic sinusitis.

8.5 Rheumatoid Arthritis, Osteoarthritis, Pain, Fever, and Gout

Arthritis is defined as inflammation of the joints, and rheumatoid arthritis is a chronic systemic disease primarily of the joints, usually polyarticular, marked by inflammatory changes in the synovial membranes and articular structures, and by muscular atrophy and rarefaction of the bones. Late stages of rheumatoid arthritis are marked by ankylosis and deformity. Rheumatoid arthritis is a crippling autoimmune disease of unknown etiology which affects over 1% of the population.

As used herein, the term "rheumatoid arthritis" is intended to include within its scope where applicable related and associated forms of arthritis well known in the art, since these may also be treated with the compounds of Formula (1.0.0). Accordingly, the term "rheumatoid arthritis" includes acute arthritis, which is arthritis marked by pain, heat, redness, and swelling due to inflammation, infection, or trauma; acute gouty arthritis, which is acute arthritis associated with gout; chronic inflammatory arthritis, which is inflammation of the joints in chronic disorders such as rheumatoid arthritis; degenerative arthritis, which is osteoarthritis; infectious arthritis, which is arthritis caused by bacteria, rickettsiae, mycoplasmas, viruses,

fungi, or parasites; Lyme arthritis, which is arthritis of the large joints associated with Lyme 20 disease; proliferative arthritis, which is inflammation of the joints with proliferation of the synovium, seen in rheumatoid arthritis; psoriatic arthritis, which is a syndrome in which psoriasis occurs in association with inflammatory arthritis; and vertebral arthritis, which is
5 inflammation involving the intervertebral disks.

The three major pathological features of rheumatoid arthritis that are responsible for progressive joint destruction are inflammation, abnormal cellular and humoral responses, and synovial hyperplasia. The particular cellular pathology of rheumatoid arthritis includes the presence of T-cells and monocytes. The T-cells, which are predominantly memory T-cells,
10 constitute up to 50% of the cells recovered from the synovial tissue of rheumatoid arthritis patients; and of the monocytes found in the same tissue, 30-50% are antigen presenting cells, which is indicative of the autoimmune character of the disease. Pro-inflammatory cytokines, e.g., IL-1, IL-4, IL-5, IL-6, IL-9, IL-13, and TNF- α , are the major contributors to joint tissue damage, inflammation, hyperplasia, pannus formation and bone resorption. See
15 Firestein, G.S. and Zvaifler, W.J., "How important are T-cells in chronic rheumatoid synovitis?" *Arth. Rheum.* 33 768-773, 1990. This has been demonstrated, e.g., by the fact that monoclonal antibodies (Mabs) to TNF- α have shown promise in RA clinical trials; Maini *et al.*, "Beneficial effects of tumor necrosis factor-alpha (TNF- α) blockade in rheumatoid arthritis (RA)," *Clin. Exp. Immunol.* 101 207-212, 1995.

The PDE4 inhibitors of Formula (1.0.0) are useful in the treatment of rheumatoid arthritis as a result of their ability to suppress the activity of a variety of inflammatory cells, including basophils, eosinophils, and mast cells. These inhibitory activities of the compounds of Formula (1.0.0) have already been described further above, as has their wide range of *in vitro* anti-inflammatory action via the release of reactive oxygen species, prostaglandins, and
25 inflammatory cytokines, e.g., IL-5, IFN- γ , and TNF- α . See further Cohan *et al.*, "In vitro pharmacology of the novel phosphodiesterase Type IV inhibitor, CP-80,633," *J. Pharm. Exp. Ther.* 278 1356-1361, 1996; and Barnette *et al.*, "SB207499 (Ariflo), a potent and selective second generation phosphodiesterase 4 inhibitor: *in vitro* anti-inflammatory actions," *J. Pharm. Exp. Ther.* 284 420-426, 1998. The PDE4 inhibitors of Formula (1.0.0) are also useful
30 in the treatment of rheumatoid arthritis as a result of their effectiveness in inhibiting T-cell proliferation mediated via a number of different agents, including antigens such as house dust mite, which has been demonstrated in the art; Barnette *et al.*, *Ibid.* The ability of the compounds of Formula (1.0.0) to facilitate the release of cytokine IL-10 from monocytes, which in turn is capable of decreasing the generation of TNF- α , IL-1, IL-4, IL-5, IL-6, IL-9, IL-
35 13, and GM-CSF by synovial fluid mononuclear cells, further augments the overall anti-inflammatory profile of the PDE4 inhibitors of Formula(1.0.0); Kambayashi *et al.*, *Ibid.* Further,

- 144 -

the ability of the compounds of Formula (1.0.0) to inhibit TNF- α release from stimulated monocytes can be correlated with animal models of inflammation in which anti-inflammatory effects can be shown to correspond to suppression of TNF- α accumulation. One such animal model involves inhibition of LPS induced TNF- α release in mice by oral administration of a PDE4 inhibitor; Cheng *et al*, "The phosphodiesterase Type 4 (PDE4) inhibitor CP-80,633 elevates cyclic AMP levels and decreases TNF- α production in mice: effect of adrenalectomy," *J. Pharm. Exp. Ther.* 280 621-626, 1997. Another such animal model involves the inhibition of rat paw edema, induced by carageenan, by oral administration of rolipram; Singh *et al*, "Synovial fluid levels of tumor necrosis factor α in the inflamed rat knee: Modulation by dexamethasone and inhibitors of matrix metalloproteinases and phosphodiesterases," *Inflamm. Res.* 46(Suppl. 2) S153-S154, 1997.

Gout refers to a group of disorders of purine metabolism, and fully developed gout is manifested by various combinations of hyperuricemia, recurrent, characteristic acute inflammatory arthritis induced by crystals of monosodium urate monohydrate, tophaceous deposits of said crystals in and around the joints of the extremities, which may lead to joint destruction and severe crippling, and uric acid urolithiasis. Rheumatic gout is another name for rheumatoid arthritis. Tophaceous gout is gout in which there are tophi or chalky deposits of sodium urate. Some therapeutic agents are useful in treating both gout and its attendant inflammation, e.g., phenylbutazone and colchicine; while other therapeutic agents possess only uricosuric properties, e.g., sulfinpyrazone and benzbromarone

Fever, or pyrexia, may be the result of any one of a large number of different factors, but with regard to the present invention such fever is either that manifested in pharyngoconjunctival fever or rheumatic fever, or that manifested during inflammation. A concomitant of inflammation is pain, especially that experienced in the joints and connective tissue of those suffering from rheumatoid arthritis and gout.

Accordingly, the PDE4 inhibitory compounds of Formula (1.0.0) provide beneficial results in the treatment of gout, and fever and pain associated with inflammation.

Animal models of rheumatoid arthritis have also been used in the art for the purpose of demonstrating the correlation between *in vivo* modulation of TNF- α by PDE4 inhibitors and their utility in the treatment of rheumatoid arthritis. The activity of rolipram in animal models of acute inflammation such as the mouse adjuvant arthritis model, has been demonstrated in the art; Sekut *et al*, "Anti-inflammatory activity of phosphodiesterase (PDE) IV inhibitors in acute and chronic models of inflammation," *Olin. Exp. Immunol.* 100(1) 126-132, 1995. The ability of rolipram to reduce disease severity in the collagen II induced arthritis (CIA) model after sc. or ip. injection has been demonstrated in the art; Nyman *et al*, "Amelioration of collagen II induced arthritis in rats by Type IV phosphodiesterase inhibitor rolipram," *Olin. Exp. Immunol.*

- 145 -

108 415-419, 1997. In this study the dosing regimen for rolipram was 2 mg/kg twice daily for five days before the onset of arthritis, and it significantly delayed the appearance of arthritic symptoms. After the cessation of treatment the test animals developed arthritis and reached the same arthritis top score as the control group. In the same study rolipram was also
5 administered at 3 mg/kg twice daily at the time point when arthritis was apparent. This treatment drastically changed the development of the disease whereby progression of severity was halted and even after the cessation of treatment, the arthritis score did not reach the levels observed in untreated animals. The investigators were also able to demonstrate a strong down-regulation of TNF- α and IFN- γ mRNA expression in regional lymph nodes, which
10 suggests that the major effect of rolipram is exerted in the effector phase of the inflammatory process. Nyman *et al*, *Ibid*.

Inhibition of TNF- α Production by Human Monocytes *In Vitro* - The inhibitory effect of the compounds of Formula (1.0.0) on *in vitro* TNF- α production by human monocytes may be determined in accordance with the protocol described in EP 411 754 (Badger *et al*) and WO
15 90/15534 (Hanna). The referenced publications also describe two models of endotoxic shock which may be used to determine *in vivo* inhibitory activity of the compounds of Formula (1.0.0). The protocols used in these models are detailed and test compounds demonstrate a positive result by reducing serum levels of TNF- α induced by the injection of endotoxin.

Selective PDE4 inhibitors such as RP73401 have been shown to exhibit significant
20 amelioration of disease, especially improvements in joint destruction, synovitis, and fibrosis, in animal models such as those involving streptococcal cell wall (SCW)-induced arthritis; Souness *et al*, "Potential of phosphodiesterase Type IV inhibitors in the treatment of rheumatoid arthritis," *Drugs* 1 541-553, 1998.

Of particular interest to the treatment of rheumatoid arthritis is the observation that
25 PDE4 inhibitors have positive effects at the site of action of the disease. For example, RP73401 has been demonstrated to decrease TNF- α mRNA expression at the pannus/cartilage interface of paw joints of collagen II treated mice. Souness *et al*, *Ibid*. RP73401 has also been studied clinically in rheumatoid arthritis patients in a placebo-controlled, double-blind Phase II study of 35 rheumatoid arthritis patients administered 400 pg of the compound t.i.d. The compound was able to induce a positive trend towards clinical
30 improvement associated with a reduction in C-reactive protein and IL-6 serum levels. Chikanza *et al*, "The clinical effects of RP73401 phosphodiesterase Type 4 inhibitor in patients with rheumatoid arthritis," *Br. J. Rheumatol* 36:Abstr. Suppl. I, 186, 1997.

Assaying Increased cAMP Accumulation in Intact Tissues Using U-937 cells -
35 Another assay suitable for demonstrating the PDE4 inhibiting activity of the compounds of Formula (1.0.0) is one which utilizes U-937 cells from a human monocyte cell line that has

been shown to contain a large amount of PDE4. In order to assess the inhibition of PDE4 activity in intact cells, non-differentiated U-937 cells at a density of approximately 10^5 cells per reaction tube are incubated with concentrations ranging from 0.01 to 1000 pM of test compound for one minute, and with 1 μ M of prostaglandin E2 for an additional four minutes.

- 5 Five minutes after initiating the reaction, cells are lysed by the addition of 17.5% perchloric acid, after which the pH is brought to neutral by the addition of 1 M potassium carbonate. The cAMP content of the reaction tube is measured using RIA techniques. A detailed protocol for carrying out this assay is described in Brooker *et al*, "Radioimmunoassay of cyclic AMP and cyclic GMP," *Adv. Cyclic Nucleotide Res.* 10 1-33, 1979.

10 **8.6 Eosinophil-Related Disorders**

- The ability of the PDE4 inhibitory compounds of Formula (1.0.0) to inhibit eosinophil activation as part of their overall anti-inflammatory activity has been described above. Accordingly, the compounds of Formula (1.0.0) are useful in the therapeutic treatment of eosinophil-related disorders. Such disorders include eosinophilia, which is the formation and
15 accumulation of an abnormally large number of eosinophils in the blood. The name of the disorder derives from "eosin", a rose-colored stain or dye comprising a bromine derivative of fluorescein which readily stains "eosinophilic leukocytes" in the blood of patients who are thus readily identified. A particular eosinophilic disorder that can be treated in accordance with the present invention is pulmonary infiltration eosinophilia, which is characterized by the
20 infiltration of the pulmonary parenchyma by eosinophils. This disorder includes especially Loffler's syndrome, which is a condition characterized by transient infiltrations of the lungs, accompanied by cough, fever, dyspnea, and eosinophilia.

- Other eosinophilic disorders include chronic eosinophilic pneumonia, which is a
25 chronic interstitial lung disease characterized by cough, dyspnea, malaise, fever, night sweats, weight loss, eosinophilia, and a chest film revealing non-segmental, non-migratory infiltrates in the lung periphery; tropical pulmonary eosinophilia, which is a subacute or chronic form of occult filariasis, usually involving *Brugia malayi*, *Wuchereria bancrofti*, or filariae that infect animals, occurs in the tropics, and is characterized by episodic nocturnal wheezing and coughing, strikingly elevated eosinophilia, and diffuse reticulonodular
30 infiltrations of the lungs; bronchopneumonic aspergillosis, which is an infection of the bronchi and lungs by *Aspergillus* fungi resulting in a diseased condition marked by inflammatory granulomatous lesions in the nasal sinuses and lungs, but also in the skin, ear, orbit, and sometimes in the bones and meninges, and leading to aspergilloma, the most common type of fungus ball formed by colonization of *Aspergillus* in a bronchus or lung cavity.

- 35 The term "granulomatous" means containing granulomas, and the term "granuloma" refers to any small nodular delimited aggregation of mononuclear inflammatory cells or such a

- 147 -

collection of modified macrophages resembling epithelial cells, usually surrounded by a rim of lymphocytes, with fibrosis commonly seen around the lesion. Some granulomas contain eosinophils. Granuloma formation represents a chronic inflammatory response initiated by various infectious and noninfectious agents. A number of such granulomatous conditions are treatable using a compound of Formula (1.0.0), e.g., allergic granulomatous angiitis, also called Churg-Strauss syndrome, which is a form of systemic necrotizing vasculitis in which there is prominent lung involvement, generally manifested by eosinophilia, granulomatous reactions, and usually severe asthma. A related disorder is polyarteritis nodosa (PAN), which is marked by multiple inflammatory and destructive arterial lesions and is a form of systemic necrotizing vasculitis involving the small and medium-sized arteries with signs and symptoms resulting from infarction and scarring of the affected organ system, in particular the lungs. Other eosinophil-related disorders which may be treated in accordance with the present invention are those affecting the airways which are induced or occasioned by a reaction to a therapeutic agent unrelated to any compound of Formula (1.0.0).

8.7 Atopic Dermatitis, Urticaria, Conjunctivitis, and Uveitis

Atopic dermatitis is a chronic inflammatory skin disorder seen in individuals with a hereditary predisposition to a lowered cutaneous threshold to pruritis, that is often accompanied by allergic rhinitis, hay fever, and asthma, and that is principally characterized by extreme itching. Atopic dermatitis is also called allergic dermatitis, and allergic or atopic eczema.

Atopic dermatitis (AD) is the most common chronic inflammatory skin disease in young children, and it affects from 10% to 15% of the population during childhood. Atopic dermatitis is frequently associated with asthma and allergies and it has therefore become known as a component of the so-called "atopic triad", since it occurs frequently in individuals with asthma and/or allergic rhinitis. See Leung Dym, *Atopic Dermatitis: From Pathogenesis To Treatment*, R.G. Landes Co., Austin, Texas, 1-226, 1996. Accordingly, the immune dysfunction associated with atopic dermatitis is treatable with therapeutic agents that are inhibitors of PDE4. For example, rolipram, Ro-201724, and denbufylline have been reported to produce a concentration-related inhibition of the proliferation of human peripheral blood mononuclear cells (HPBM) from normal patients as well as from subjects with atopic dermatitis. See, respectively, Torphy *et al.*, *Drugs and the Lung*, Eds. Page and Metzger, Raven Press, New York, 1994; and O'Brien, *Mol. Medicine Today*, 369, 1997. These studies also determined that the proliferative response of HPBM from atopic dermatitis patients was more sensitive to PDE4 inhibition than was the proliferation observed in HPBM from normal subjects.

Th2 type cytokine secreting T-cells expressing the cutaneous lymphocyte associated antigen play a central role in the induction of local IgE responses and the recruitment of

- 148 -

eosinophils in this disease. The chronic inflammation seen in atopic dermatitis is considered to be the result of several interdependent factors, such as repeated or persistent allergen exposure, which can lead to Th2 cell expansion. It has been demonstrated that there is an increased frequency of allergen specific T-cells producing increased IL-4, IL-5, and IL-3 levels in the blood of atopic dermatitis patients. See Leung Dym *et al.*, "Allergic and immunological skin disorders," *JAMA* 278(22) 1914-1923, 1997. This is significant because IL-4 and IL-3 induce the expression of vascular adhesion molecule-1 (VCAM-1), an adhesion molecule involved in the migration of mononuclear cells and eosinophils into sites of tissue inflammation. Further, IL-5 is a key mediator of eosinophil activation, which is a common feature of atopic disease.

Increased concentration of cAMP in lymphocytes and basophils has long been known to be associated with decreased mediator release from those cells, and more recently it has been reported that histamine acting on H2 receptors increases cAMP levels and inhibits IL-4 production in murine Th2 cells. It is surmised, accordingly, that there is present in atopic diseases such as atopic dermatitis, impaired β -adrenergic responses or enhanced PDE4 activity of leukocyte inflammatory responses. A diminished cAMP response may result from an enhanced PDE4 activity that has a genetic basis or that is an acquired condition.

Studies have been carried out which compare different cell types from atopic patients with those from healthy volunteers, and the results have shown that increased cAMP-PDE activity in atopic cells correlates with abnormal inflammatory and immune cell function in atopic dermatitis. Further, the PDE4 enzyme from atopic leukocytes is more sensitive to PDE4 inhibitors than the PDE4 enzyme from normal leukocytes, and up to a 14-fold difference has been demonstrated. See Chan and Hanifin, "Differential inhibitory effects of cAMP phosphodiesterase isoforms in atopic and normal leukocytes," *J. Lab. Clin. Med.*, 121(1) 44-51, 1993. An increased sensitivity can also be seen in the inhibition of proliferation of peripheral blood mononuclear cells from atopic donors on treatment with PDE4 inhibitors. For example, rolipram has been found to be more effective at inhibiting PHA stimulated atopic dermatitis PBMC proliferation than at inhibiting PHA stimulated normal PBMC proliferation, with an IC_{50} = 280 nM compared to an IC_{50} = 2600 nM, respectively.

Further, it has been shown that a structurally diverse range of selective PDE4 inhibitors are effective in reducing skin eosinophilia in the guinea pig which has been mediated via a range of agents such as PAF, arachidonic acid, zymosan activated plasma, and protein of cutaneous anaphylaxis. See Beasley *et al.*, "Synthesis and evaluation of a novel series of phosphodiesterase 4 inhibitors. A potential treatment for asthma," *Bioorg. Med. Chem. Letts.* 8 2629-2634, 1998. Such data shows the utility of PDE4 inhibitors in treating eosinophil driven skin diseases. Such treatment is by means of topical

- 149 -

administration, e.g., topical atizoram applied bilaterally over eight days to twenty patients in a clinical trial has been found to effectively inhibit all of the inflammatory parameters tested, showing both qualitative and quantitative improvements with no adverse effects. See Hanifin *et al.*, "Type 4 phosphodiesterase inhibitors have clinical and *in vitro* anti-inflammatory effects in atopic dermatitis," *J. Invest. Dermatol.* 107 51-56, 1996.

Accordingly, the PDE4 inhibitors of Formula (1.0.0) are useful for the beneficial treatment of atopic dermatitis as described above. A related area of therapeutic application for which the compounds of Formula (1.0.0) also produce beneficial results is in the treatment of urticaria. Urticaria is a vascular reaction, usually transient, involving the upper dermis, representing localized edema caused by dilatation and increased permeability of the capillaries, and marked by the development of wheals or hives. Many different stimuli are capable of inducing an urticarial reaction, and it may be classified according to precipitating causes, as: immune-mediated, complement-mediated which may involve immunologic or nonimmunologic mechanisms, urticariogenic material-induced, physical agent-induced, stress-induced, or idiopathic. The condition may also be designated acute or chronic depending on the duration of an attack. Angioedema is the same response in the deep dermis or subcutaneous or submucosal tissues.

The most common types of urticaria which are treatable with the compounds of Formula (1.0.0) are cholinergic urticaria which is characterized by the presence of distinctive punctate wheals surrounded by areas of erythema, thought to be a nonimmunologic hypersensitivity reaction in which acetylcholine released from parasympathetic or motor nerve terminals induces release of mediators from mast cells, and evoked by conditions of exertion, stress, or increased environmental heat; cold urticaria which is urticaria precipitated by cold air, water, or objects, occurring in two forms: in the autosomal dominant form which is associated with fevers, arthralgias, and leukocytosis, the lesions present are erythematous, burning papules and macules, and in the more common acquired form which is usually idiopathic and self-limited; contact urticaria which is a localized or generalized transient wheal-and-flare response elicited by exposure to rapidly absorbable urticariogenic agents; giant urticaria which is angioedema; and papular urticaria which is a persistent cutaneous eruption representing a hypersensitivity reaction to insect bites.

Accordingly, the PDE4 inhibitors of Formula (1.0.0) are useful for the beneficial treatment of the various types of urticaria as described above. A related area of therapeutic application for which the compounds of Formula (1.0.0) also produce beneficial results is in various ophthalmic uses, in particular in the treatment of conjunctivitis and uveitis.

The conjunctiva is a delicate membrane that lines the eyelids and covers the exposed surface of the sclera. Conjunctivitis is an inflammation of the conjunctiva that generally

- 150 -

consists of conjunctival hyperemia associated with a discharge. The most common types of conjunctivitis, which are treatable with the compounds of Formula (1.0.0), are actinic conjunctivitis produced by ultraviolet light; acute catarrhal conjunctivitis which is an acute, infectious conjunctivitis associated with cold or catarrh and characterized by vivid hyperemia, edema, loss of translucence, and mucous or mucopurulent discharge; acute contagious conjunctivitis which is a mucopurulent, epidemic conjunctivitis caused by *Haemophilus aegyptius* that has the same symptoms as acute catarrhal conjunctivitis and is also called "pinkeye"; allergic conjunctivitis which is a component of hay fever; atopic conjunctivitis which is allergic conjunctivitis of the immediate type caused by airborne allergens, e.g., pollens, dusts, spores, and animal dander; chronic catarrhal conjunctivitis which is a mild, chronic conjunctivitis with only slight hyperemia and mucous discharge; purulent conjunctivitis which is an acute conjunctivitis caused by bacteria or viruses, particularly gonococci, meningococci, pneumococci, and streptococci, and characterized by severe inflammation of the conjunctiva and copious discharge of pus; and vernal conjunctivitis which is a bilateral conjunctivitis of seasonal occurrence, of unknown cause, affecting children especially boys and characterized by flattened papules and a thick, gelatinous exudate. Accordingly, the PDE4 inhibitors of Formula (1.0.0) are useful for the beneficial treatment of the various types of conjunctivitis as described above. A related area of therapeutic application for which the compounds of Formula (1.0.0) also produce beneficial results is in the treatment of uveitis.

The uvea is the vascular middle coat or tunic of the eye, comprising the iris, ciliary body, and choroid. Uveitis is an inflammation of all or part of the uvea and commonly involves the other tunics of the eye, i.e., the sclera and the cornea, and the retina as well. The most common types of uveitis, which are treatable with the compounds of Formula (1.0.0), are anterior uveitis which is uveitis involving the structures of the iris and/or ciliary body, including iritis, cyclitis, and iridocyclitis; granulomatous uveitis which is uveitis of any part of the uveal tract but particularly of the posterior portion, characterized by nodular collections of epithelioid cells and giant cells surrounded by lymphocytes; nongranulomatous uveitis which is inflammation of the anterior portion of the uveal tract, i.e., the iris and ciliary body; phacoantigenic uveitis which is one of the lens-induced uveitides is a severe anterior uveitis similar to sympathetic ophthalmia, observed weeks or even months after extracapsular lens surgery or other trauma to the capsule; and posterior uveitis which is uveitis involving the posterior segment of the eye, including choroiditis and chorioretinitis. Accordingly, the PDE4 inhibitors of Formula (1.0.0) are useful for the beneficial treatment of the various types of uveitis as described above.

8.8 Psoriasis

Psoriasis is a common chronic, squamous dermatosis with polygenic inheritance and a fluctuating course that is characterized by microabscesses and spongiform pustules, as well

- 151 -

as erythematous, dry, scaling patches of various sizes. Psoriasis is a common skin disease that affects approximately 2% of the population, and more than 1½ million patients in the US annually consult physicians for treatment. Psoriasis is usually recurrent and in some instances can be very debilitating. The etiology of psoriasis is unknown, but it appears to be
5 an autoimmune disease with genetic predisposition.

Psoriasis involves a large T-cell infiltration in the affected regions of the skin, with CD4+ lymphocytes in the dermis and CD8+ lymphocytes in the epidermis. These lymphocytes secrete IL-2, IFN- γ , and TNF- α , which alter keratinocyte proliferation and differentiation. Further, from 5% to 10% of psoriasis patients develop psoriatic arthritis, the
10 symptoms of which are very similar to those of rheumatoid arthritis. The broad spectrum of anti-inflammatory activities displayed by PDE4 inhibitors, already discussed above, enables such inhibitors to be used beneficially in the treatment of psoriasis.

It has been demonstrated that treatment of epidermal basal cells, in primary culture, with the PDE4 inhibitor Ro 20-1724 leads to a three-fold increase in cAMP concentrations. It
15 has also been shown that treatment of psoriatic epidermal slices and keratomed psoriatic epidermal slices with Ro 20-1724 results in a very marked elevation of cAMP concentrations over controls. Specifically, a 1395% increase in cAMP concentration in keratomed psoriatic epidermis has been observed. PDE4 inhibitors have also been shown to inhibit the inflammatory response of a number of mediators *via* either topical or systemic administration.
20 For example, rolipram has been shown to inhibit croton oil-induced ear inflammation in the mouse at topical doses as low as 0.03 mg per ear. The selective PDE4 inhibitor Ro 20-1724 has also been investigated in two double-blind studies comparing its effectiveness to vehicle, where it has been shown to improve psoriatic lesions without adverse systemic or cutaneous effects.

25 **8.9 Multiple Sclerosis and Other Inflammatory Autoimmune Diseases**

A sclerosis is an induration, or hardening, and refers especially to hardening of a part from inflammation, and from increased formation of connective tissue and in diseases of the interstitial substance. The term "sclerosis" is used chiefly for such a hardening of the nervous system due to the deposition of connective tissue, or to designate hardening of the blood
30 vessels. Multiple sclerosis (MS) is a disease in which there are foci of demyelination of various sizes throughout the white matter of the central nervous system, sometimes extending into the gray matter, resulting in weakness, incoordination, paresthesias, speech disturbances, and visual complaints. Multiple sclerosis is a disease of unknown etiology with a prolonged course involving many remissions and relapses.

35 Multiple sclerosis is an autoimmune disease that in addition to chronic inflammation and demyelination, also results in gliosis within the central nervous system. There are

several disease subtypes, including primary progressive multiple sclerosis, and relapsing remitting multiple sclerosis. These disease subtypes may be distinguished from each other on the basis of the course of the disease, of the type of inflammation involved, and through the use of magnetic resonance imaging (MRI). It is also possible for the basic disease
5 mechanism to change during the course of multiple sclerosis, with an inflammation-based process being replaced later by one which involves demyelination and axonal damage. See Weillbach and Gold, "Disease modifying treatments for multiple sclerosis. What is on the horizon?" *CNS Drugs* 11 133-157, 1999.

In multiple sclerosis inflammatory lesions are localized to, but prevalent throughout
10 the white matter of the central nervous system, although sclerotic plaques characterized by demyelination are a hallmark of the disease. The development of demyelination, in turn, is caused by the necrosis of oligodendrocytes, and demyelination is associated with an infiltrate composed mainly of T-cells and macrophages, which together with local cells such as astrocytes, microglia and microvascular brain endothelial cells, express major
15 histocompatibility complex (MHC) class II. These cells are thus implicated in antigen presentation and an inflammatory response, and a number of pro-inflammatory cytokines, including TNF- α , TNF- β , IL-1, IL-6 and IFN- γ have been identified in the brain tissue of multiple sclerosis patients and their presence is generally associated with active lesions. TNF- α in particular has been the focus of attention because it mediates myelin and
20 oligodendrocyte damage *in vitro*, induces astrocytes to express surface adhesion molecules, and is associated with disruption of the blood-brain barrier.

Animal models have been used to demonstrate the role of TNF- α in multiple sclerosis, e.g., in experimental allergic encephalomyelitis (EAE) administration of anti-TNF antibodies or soluble TNF receptors has been shown to provide a protective effect. See
25 Selmaj *et al.*, "Prevention of chronic relapsing experimental autoimmune encephalomyelitis by soluble tumor necrosis factor," *J. Neuroimmunol.* 56 135-141, 1995. A direct correlation between the level of TNF- α mRNA and progression of EAE has also been reported. See Reeno *et al.*, "TNF-alpha expression by resident microglia and infiltrating leukocytes in the central nervous system of mice with experimental allergic encephalomyelitis: regulation by the
30 Th1 cytokines," *J. Immunol.* 154 944-953, 1995. Further evidence demonstrating that TNF- α is a mediator of multiple sclerosis is the increased concentration of TNF- α in the cerebrospinal fluid of multiple sclerosis patients during the course of the disease. Further, a transgenic mouse overexpressing TNF- α in the central nervous system has shown signs of spontaneous demyelination, while a transgenic TNF- α knockout mouse has shown a
35 protective effect. See Probert *et al.*, "Spontaneous inflammatory demyelinating disease in transgenic mice showing central nervous system-specific expression of tumor necrosis factor

alpha," *Proc. Natl. Acad. Sci. USA* 92 11294-11298, 1995; and Liu *et al.*, "TNF is a potent anti-inflammatory cytokine in autoimmune-mediated demyelination," *Nature Med.* 4 78-83, 1998.

Since PDE4 inhibitors also reduce TNF- α , they are beneficial in the treatment of multiple sclerosis because TNF- α plays a key role in mediating multiple sclerosis, as discussed above. For example, in a marmoset model of experimental allergic encephalomyelitis rolipram has been found to suppress the appearance of clinical signs and abolish abnormalities in MRI imaging. In another study of the effects of rolipram on chronic relapsing experimental allergic encephalomyelitis in SJL mice, it has been shown that rolipram ameliorates clinical signs and pathological changes in this model. See Genain *et al.*, "Prevention of autoimmune demyelination in non-human primates by a cAMP-specific phosphodiesterase," *Proc. Natl. Acad. Sci. USA* 92 3601-3605, 1995; and Sommer *et al.*, "Therapeutic potential of phosphodiesterase Type 4 inhibition in chronic autoimmune demyelinating disease," *J. Neuroimmunol.* 79 54-61, 1997.

In addition to inhibiting PDE4 activity and the production of TNF- α , the compounds of Formula (1.0.0) also possess activity as immunosuppressive agents and are especially useful for treating autoimmune diseases in which inflammation is a component part of the autoimmune disease, or in which inflammation is part of the etiology of the autoimmune disease, or in which inflammation is otherwise involved with the autoimmune disease. Alternatively, the compounds of Formula (1.0.0) are anti-inflammatory agents useful in the treatment of inflammatory diseases in which autoimmune reactions are a component part of the inflammatory disease, or in which autoimmune reactions are part of the etiology of the inflammatory disease, or in which autoimmune reactions are otherwise involved with the inflammatory disease. Accordingly, the compounds of Formula (1.0.0) are useful in the treatment of multiple sclerosis, as discussed in detail further above.

Other autoimmune/inflammatory diseases that can be treated by therapeutic agents comprising the compounds of Formula (1.0.0) include, but are not limited to, autoimmune hematological disorders such as hemolytic anemia, aplastic anemia, pure red cell anemia, and idiopathic thrombocytopenic purpura; systemic lupus erythematosus; polychondritis; scleroderma; Wegner's granulomatosis; dermatomyositis; chronic active hepatitis; myasthenia gravis; Stevens-Johnson syndrome; idiopathic sprue; autoimmune inflammatory bowel diseases such as ulcerative colitis and Crohn's disease; endocrin ophthalmopathy; Grave's disease; sarcoidosis; alveolitis; chronic hypersensitivity pneumonitis; primary biliary cirrhosis; juvenile diabetes (diabetes mellitus type I); anterior uveitis and granulomatous (posterior) uveitis; keratoconjunctivitis sicca and epidemic keratoconjunctivitis; diffuse interstitial pulmonary fibrosis (interstitial lung fibrosis); idiopathic pulmonary fibrosis; cystic fibrosis;

- 154 -

psoriatic arthritis; glomerulonephritis with and without nephrotic syndrome, including acute glomerulonephritis, idiopathic nephrotic syndrome, and minimal change nephropathy; inflammatory/hyperproliferative skin diseases including psoriasis and atopic dermatitis discussed in detail further above, contact dermatitis, allergic contact dermatitis, benign familial pemphigus, pemphigus erythematosus, pemphigus foliaceus, and pemphigus vulgaris.

Further, the compounds of Formula (1.0.0) may be used as immunosuppressant agents for the prevention of allogeneic graft rejection following organ transplantation, where such organs typically include tissue from bone marrow, bowel, heart, kidney, liver, lung, pancreas, skin and cornea.

10 **8.10 Inflammatory Bowel Disease**

Ulcerative colitis (UC) is a chronic, recurrent ulceration in the colon, chiefly of the mucosa and submucosa, which is of unknown cause, and which is manifested clinically by cramping abdominal pain, rectal bleeding, and loose discharges of blood, pus, and mucus with scanty fecal particles. Related diseases of the bowel include collagenous colitis, which is
15 a type of colitis of unknown etiology that is characterized by deposits of collagenous material beneath the epithelium of the colon, and marked by crampy abdominal pain with a conspicuous reduction in fluid and electrolyte absorption that leads to watery diarrhea; colitis polyposa, which is ulcerative colitis associated with the formation of pseudopolyps, i.e., edematous, inflamed islands of mucosa between areas of ulceration; and transmural colitis,
20 which is inflammation of the full thickness of the bowel, rather than mucosal and submucosal disease, usually with the formation of noncaseating granulomas, that clinically resembles ulcerative colitis but in which the ulceration is often longitudinal or deep, the disease is often segmental, stricture formation is common, and fistulas, particularly in the perineum, are a frequent complication.

25 Crohn's disease (CD) is a chronic granulomatous inflammatory disease of unknown etiology involving any part of the gastrointestinal tract, but commonly involving the terminal ileum with scarring and thickening of the bowel wall, frequently leading to intestinal obstruction, and fistula and abscess formation, and having a high rate of recurrence after treatment. Ulcerative colitis, Crohn's disease and the related diseases discussed above are
30 collectively referred to as inflammatory bowel disease (IBD). These diseases are chronic, spontaneously relapsing disorders of unknown cause that are immunologically mediated and whose pathogenesis has been established through the use of animal models and advanced immunological techniques. See Bickston and Caminelli, "Recent developments in the medical therapy of IBD," *Curr. Opin. Gastroenterol.* 14 6-10, 1998; and Murthy *et al.*, "Inflammatory
35 bowel disease: A new wave of therapy," *Exp. Opin. Ther. Patents* 8(7) 785-818, 1998. While the incidence of ulcerative colitis has remained relatively stable, the incidence of Crohn's disease has increased significantly.

- 155 -

Current therapy for inflammatory bowel disease includes 5-aminosalicylic acid, corticosteroids, and immunomodulators such as azathioprine, 6-mercaptopurine, and methotrexate. These agents have a wide range of adverse side effects and do not modify the disease itself, and there is thus an ongoing need for more effective treatment agents. The compounds of Formula (1.0.0) are able to beneficially treat inflammatory bowel diseases as a result of their ability to inhibit the production of TNF- α , because TNF- α causes immune cell activation, proliferation, and mediator release in inflammatory bowel disease. See Radford-Smith and Jewell, "Cytokines and inflammatory bowel disease." *Baillieres Clin. Gastroenterol.* **10** 151-164, 1996. TNF- α has also been detected in the stools and intestinal mucosa of patients with inflammatory bowel disease. Further, early clinical studies in Crohn's disease using TNF monoclonal antibodies have shown significant promise.

As already detailed further above, selective PDE4 inhibitors have a marked effect on the inhibition of TNF- α release from peripheral blood mononuclear cells after those cells have been stimulated with a wide range of mediators, both *in vitro* and *in vivo*. The selective PDE4 inhibitor arylpylline has been shown to provide beneficial effects when tested in models of colitis in the rat. Further, in a dextran sulfate induced colitis model in the rat, rolipram and the selective PDE4 inhibitor LAS31025 have demonstrated beneficial effects comparable to prednisolone. Both test compounds have been shown to ameliorate bleeding and inflammatory markers. See Puig *et al.* "Curative effects of phosphodiesterase 4 inhibitors in dextran sulfate sodium induced colitis in the rat," *Gastroenterology* **114**(4) A1064, 1998. Other workers have used additional models to demonstrate the ability of selective PDE4 inhibitors to provide gastrointestinal protection. For example, it has been shown that lipopolysaccharide induced erythrocyte extravasation in rats and intestinal hypoperfusion in dogs can be attenuated with the selective PDE4 inhibitors rolipram and denbutylline. See Cardelus *et al.*, "Inhibiting LPS induced bowel erythrocyte extravasation in rats, and of mesenteric hypoperfusion in dogs, by phosphodiesterase inhibitors," *Eur. J. Pharmacol.* **299** 153-159, 1996; and Cardelus *et al.*, "Protective effects of denbutylline against endotoxin induced bowel hyperplasia," *Met. Find. Exp. Clin. Pharmacol.* **17**(Suppl. A) 142, 1995.

8.11 Septic Shock, Renal Failure, Cachexia, and Infection

Septic shock is shock associated with overwhelming infection, most commonly infection with gram negative-bacteria, although it may be produced by other bacteria, viruses, fungi and protozoa. Septic shock is deemed to result from the action of endotoxins or other products of the infectious agent on the vascular system, causing large volumes of blood to be sequestered in the capillaries and veins. Activation of the complement and kinin systems and the release of histamine, cytokines, prostaglandins, and other mediators is also involved.

It has been shown in a model of endotoxin-induced acute renal failure in rats that the selective PDE4 inhibitor, Ro-201724, given as a post-treatment at 10 µg/kg/min significantly increases urinary cAMP excretion, markedly attenuates endotoxin-induced increases in renal vascular resistance and decreases in renal blood flow and glomerular filtration rate. Ro-201724 has also been shown to improve survival rates for endotoxin-treated rats. See Carcillo *et al.*, *Pharmacol. Exp. Ther.* 279 1197, 1996. Pentoxifylline has also been studied in patients suffering from septic shock. In this study twenty-four individuals fulfilling the criteria for septic shock have been selected, twelve of which have received pentoxifylline at 1 mg/kg/hr over a 24-hour period, while the other twelve have served as a control group. After 24 hours it has been found that the TNF-α levels in the therapy group have been significantly lowered, while the IL-6 levels have been significantly increased.

In another study, it has been shown that pretreatment with pentoxifylline at 5 to 50 mg/kg i.p. 3X, or with the selective PDE4 inhibitors rolipram at 10 to 30 mg/kg i.p. 3x, and denbufylline at 0.1 to 3 mg/kg i.p. 3x, reduces lipopolysaccharide-induced bowel erythrocyte extravasation in rats, and that denbufylline is 100-fold more potent than pentoxifylline in inhibiting lipopolysaccharide-induced mesenteric blood flow fall, without affecting renal blood flow or cardiac index. See Cardelus *et al.*, *Ibid.*, *Eur. J. Pharmacol.*

Renal failure is the inability of the kidney to excrete metabolites at normal plasma levels under conditions of normal loading, or the inability to retain electrolytes under conditions of normal intake. In the acute form, it is marked by uremia and usually by oliguria or anuria, with hyperkalemia and pulmonary edema. On the basis of the above-described activities of selective PDE4 inhibitors, it has been demonstrated that selective PDE4 inhibitors are useful in the treatment of renal failure, especially acute renal failure. See Begany *et al.*, "Inhibition of Type IV phosphodiesterase by Ro-20-1724 attenuates endotoxin-induced acute renal failure," *J. Pharmacol. Exp. Ther.* 278 37-41, 1996. See also WO 98/00135 assigned to the University of Pittsburgh. Accordingly, the compounds of Formula (1.0.0) are useful in the treatment of renal failure, particularly acute renal failure.

Cachexia is a profound and marked state of constitutional disorder characterized by general ill health and malnutrition. Cachexia may be the end result of a number of causative factors, e.g., it may result from infection by any one of a number of different unicellular organisms or microorganisms including bacteria, viruses, fungi, and protozoans. Malarial cachexia is representative and comprises a group of signs of a chronic nature that result from antecedent attacks of severe malaria, the principal signs being anemia, sallow skin, yellow sclera, splenomegaly, and hepatomegaly. Another cause of cachexia is the deprivation or deterioration of humoral or other organic functions, e.g., hypophysial cachexia comprises a train of symptoms resulting from total deprivation of function of the pituitary gland, including

- 157 -

phthisis, loss of sexual function, atrophy of the pituitary target glands, bradycardia, hypothermia, apathy, and coma. Uremic cachexia is cachexia associated with other systemic symptoms of advanced renal failure. Cardiac cachexia comprises the emaciation due to heart disease. Cachexia suprarenalis, or Addison's disease, is a disorder characterized by

5 hypotension, weight loss, anorexia, and weakness, caused by adrenocortical hormone deficiency. It is due to tuberculosis- or autoimmune-induced destruction of the adrenal cortex that results in deficiency of aldosterone and cortisol.

Cachexia may also be the result of disease states of various types. Cancerous cachexia comprises the weak, emaciated condition seen in cases of malignant tumor.

10 Cachexia can also be a consequence of infection by the human immunodeficiency virus (HIV), and comprises the symptoms commonly referred to as acquired immune deficiency syndrome (AIDS). The compounds of Formula (1.0.0) are useful in treating cachexia of the different types described above as a result of their ability to provide down-regulation or inhibition of TNF- α release. The selective PDE4 inhibitors of the present invention have a

15 marked effect on the inhibition of TNF- α release from peripheral blood mononuclear cells after those cells have been stimulated with a wide range of mediators. TNF- α release is implicated or plays a mediating role in diseases or conditions whose etiology involves or comprises morbid, i.e., unhealthy, excessive or unregulated TNF- α release.

The PDE4 inhibitory compounds of Formula (1.0.0) are further useful in the treatment

20 of infection, especially infection by viruses wherein such viruses increase the production of TNF- α in their host, or wherein such viruses are sensitive to upregulation of TNF- α in their host so that their replication or other vital activities are adversely impacted. Such viruses include, e.g., HIV-1, HIV-2, and HIV-3; cytomegalovirus, CMV; influenza; adenoviruses; and Herpes viruses, especially *Herpes zoster* and *Herpes simplex*.

The PDE4 inhibitory compounds of Formula (1.0.0) are further useful in the treatment

25 of yeast and fungus infections wherein said yeast and fungi are sensitive to upregulation by TNF- α or elicit TNF- α production in their host. A particular disease which is treatable in this way is fungal meningitis. The compounds of Formula (1.0.0) also provide beneficial effects when combined with, i.e., administered in conjunction with other drugs of choice for the

30 treatment of systemic yeast and fungus infections. Such drugs of choice include, but are not limited to polymyxins, e.g., Polymyxin B; imidazoles, e.g., clotrimazole, econazole, miconazole, and ketoconazole; triazoles, e.g., fluconazole and itraconazole; and amphotericins, e.g., Amphotericin B and liposomal Amphotericin B. The term "co-administration" as used herein with reference to the compounds of Formula (1.0.0) and drugs of choice for the

35 treatment of systemic yeast and fungus infections, is intended to mean and include (a) simultaneous administration of such compound(s) and drug(s) to a subject when

- 158 -

- formulated together into a single dosage form; (b) substantially simultaneous administration of such compound(s) and drug(s) to a subject when formulated apart from each other into separate dosage forms; and (c) sequential administration of such compound(s) and drug(s) to a subject when formulated apart from each other and administered consecutively with some significant time interval between.

8.12 Liver Injury

- In addition to the above-described adverse effects of TNF- α , it also causes hepatic failure in humans, a phenomenon which has been shown in a number of animal models. For example, in an acute model of T-cell mediated hepatic failure, rolipram administered at 0.1 to 10 mg/kg i.p. 30 minutes before challenge with either concanavalin A or staphylococcal enterotoxin B, has been shown to significantly reduce plasma TNF- α and INF- γ concentrations, whereas it also significantly elevates IL-10 levels. See Gantner *et al.*, *J. Pharmacol. Exp. Ther.* 280 53, 1997. In this same study, rolipram has also been shown to suppress concanavalin A-induced IL-4 release. The plasma activities of the liver specific enzymes ALT, AST, and SDH have also been assessed in this study, since any increase in their levels would indicate massive liver cell destruction. It has been found that in pretreatment of naïve mice receiving concanavalin A, or galactosamine-sensitized mice receiving galactosamine/staphylococcal enterotoxin B, with rolipram at 0.1 to 10 mg/kg i.p., that rolipram has dose-dependently inhibited the above-mentioned plasma enzyme activities. Accordingly, the compounds of Formula (1.0.0) are useful in the treatment of T-cell disorders such as liver failure.

8.13 Pulmonary Hypertension

- It is known that the activity of phosphodiesterases, which hydrolyze the vasodilatory second messengers cAMP and cGMP, may be increased by hypoxia-induced pulmonary hypertension (HPH). Hypoxia is a reduction of oxygen supply to tissue below physiological levels despite adequate perfusion of the tissue by blood. The resulting pulmonary hypertension is characterized by increased pressure, i.e., above 30 mm Hg systolic and above 12 mm. Hg diastolic, within the pulmonary arterial circulation. Using a model which utilizes isolated pulmonary artery rings from normal rats and from rats with hypoxia-induced pulmonary hypertension, it has been shown that the selective PDE4 inhibitor rolipram potentiates the relaxant activities of isoproterenol and forskolin. The same effect has been observed with milrinone, which is a selective PDE3 inhibitor, thereby supporting inhibition of both PDE3 and PDE4 in order to significantly improve pulmonary artery relaxation in hypoxia-induced pulmonary hypertension. See Wagner *et al.*, *J. Pharmacol. Exp. Ther.* 282 1650, 1997. Accordingly, the compounds of Formula (1.0.0) are useful in the treatment of pulmonary hypertension, especially hypoxia-induced pulmonary hypertension.

8.14 Bone Loss Disease

Bone loss disease, more commonly referred to as osteoporosis, is a condition of low bone mass and microarchitectural disruption that results in fractures with minimal trauma. Secondary osteoporosis is due to systemic illness or medications such as glucocorticoids. 5 Primary osteoporosis, it has been contended, should be viewed as comprising two conditions: Type I osteoporosis which is loss of trabecular bone due to estrogen deficiency at menopause, and Type II osteoporosis which is loss of cortical and trabecular bone due to long-term remodeling inefficiency, dietary inadequacy, and activation of the parathyroid axis with age. The primary regulators of adult bone mass include physical activity, reproductive 10 endocrine status, and calcium intake, and optimal maintenance of bone requires sufficiency in all three areas.

It has been demonstrated that selective PDE4 inhibitors are useful in the beneficial treatment of bone loss disease, particularly osteoporosis. The effect of denbufylline on bone loss in Walker 256/S-bearing rats and on mineralized nodule formation and osteoclast-like cell 15 formation has been studied in bone marrow culture systems. It has been discovered that serial oral administrations of denbufylline inhibit the decrease in the bone mineral density of femurs from Walker 256/S-bearing rats, and restore the bone mass and the number of osteoclasts and osteoblasts per trabecular surface in the femur metaphysis. The administration of denbufylline has also been found to result in an increase in the number of 20 mineralized nodules and a decrease in the number of osteoclast-like cells in the *in vitro* bone marrow culture system. These beneficial effects are specific for PDE4 inhibition and are mimicked by dibutyl cAMP, demonstrating that the PDE4 isozyme plays an important role in bone turnover through cAMP. See Miyamoto *et al.*, *Biochem. Pharmacol.* **54** 613, 1997; Waki *et al.*, "Effects of XT-44, a phosphodiesterase 4 inhibitor, in osteoblastogenesis and 25 osteoclastogenesis in culture and its therapeutic effects in rat osteopenia models," *Jpn. J. Pharmacol.* **79** 477-483, 1999; and JP 9169665 assigned to Miyamoto (1997). Consequently, the selective PDE4 inhibitors of Formula (1.0.0) are useful in the treatment of diseases involving bone loss, especially osteoporosis.

8.15 CNS disorders

30 The PDE4 selective inhibitor rolipram was initially developed as an antidepressant and continues to be studied in clinical trials for that indication. Further, it has been demonstrated that selective PDE4 inhibitors provide beneficial effects in other central nervous system disorders, including Parkinson's disease, Hulley *et al.*, "Inhibitors of Type IV phosphodiesterases reduce the toxicity of MPTP in substantia nigra neurons *in vivo*," *Eur. J. Neurosci.* **7** 2431-2440, 1995; as well as learning and memory impairment, Egawa *et al.*, 35 "Rolipram and its optical isomers, phosphodiesterase 4 inhibitors, attenuate the scopolamine-induced impairments of learning and memory in rats," *Jpn. J. Pharmacol.* **75** 275-281, 1997;

- 160 -

Imanishi *et al.*, "Ameliorating effects of rolipram on experimentally induced impairments of learning and memory in rodents," *Eur. J. Pharmacol.* **321** 273-278, 1997; and Barad *et al.*, "Rolipram, a Type IV-specific phosphodiesterase inhibitor, facilitates the establishment of long-lasting long-term potentiation and improves memory," *Proc. Natl. Acad. Sci. USA* **95** 15020-15025, 1998.

The use of PDE4 inhibitors to treat tardive dyskinesia and drug dependence has also been disclosed in the art, WO 95/28177 and JP 92221423 (1997), both assigned to Meiji Seika Kaisha Ltd. The PDE4 isozyme has been found to play a major role in controlling dopamine biosynthesis in mesencephalic neurons; accordingly PDE4 inhibitors are useful in the treatment of disorders and diseases which are associated with or mediated by dopamine within and around mesencephalic neurons, Yamashita *et al.*, "Rolipram, a selective inhibitor of phosphodiesterase Type 4, pronouncedly enhances the forskolin-induced promotion of dopamine biosynthesis in primary cultured rat mesencephalic neurons," *Jpn. J. Pharmacol.* **75** 91-95, 1997.

The PDE4 inhibitory compounds of Formula (1.0.0) are further useful in the treatment of arteriosclerotic dementia and subcortical dementia. Arteriosclerotic dementia, also called vascular dementia and multi-infarct dementia, is a dementia with a stepwise deteriorating course in the form of a series of small strokes, and an irregular distribution of neurological deficits caused by cerebrovascular disease. Subcortical dementia are caused by lesions affecting subcortical brain structures and are characterized by memory loss with slowness in processing information or making intellectual responses. Included are dementias that accompany Huntington's chorea, Wilson's disease, paralysis agitans, and thalamic atrophies.

8.16 Other Therapeutic Applications

It has been demonstrated that PDE4 inhibitors are useful in the treatment of ischemia-reperfusion injury, Block *et al.*, "Delayed treatment with rolipram protects against neuronal damage following global ischemia in rats," *NeuroReport* **8** 3829-3832, 1997 and Belayev *et al.* "Protection against blood-brain barrier disruption in focal cerebral ischemia by the Type IV phosphodiesterase inhibitor BBB022: a quantitative study," *Brain Res.* **787** 277-285, 1998; in the treatment of autoimmune diabetes, Liang *et al.*, "The phosphodiesterase inhibitors pentoxifylline and rolipram prevent diabetes in NOD mice," *Diabetes* **47** 570-575, 1998; in the treatment of retinal autoimmunity, Xu *et al.*, "Protective effect of the Type IV phosphodiesterase inhibitor rolipram in EAU: protection is independent of the IL-10-inducing activity," *Invest. Ophthalmol. Visual Sci.* **40** 942-950, 1999; in the treatment of chronic lymphocytic leukemia, Kim and Lerner, "Type 4 cyclic adenosine monophosphate phosphodiesterase as a therapeutic agent in chronic lymphocytic leukemia," *Blood* **92** 2484-2494, 1998; in the treatment of HIV infections, Angel *et al.*, "Rolipram, a specific Type IV phosphodiesterase inhibitor, is a potent inhibitor of HIV-1 replication," *AIDS* **9** 1137-1144,

- 161 -

1995 and Navarro *et al.*, "Inhibition of phosphodiesterase Type IV suppresses human immunodeficiency virus Type 1 replication and cytokine production in primary T cells: involvement of NF-kappaB and NFAT," *J. Virol.* 72 4712-4720, 1998; In the treatment of lupus erythematosus, JP 10067682 (1998) assigned to Fujisawa Pharm. Co. Ltd.; in the treatment
5 of kidney and ureter disease, DE 4230755 (1994) assigned to Schering AG ; in the treatment of urogenital and gastrointestinal disorders, WO 94/06423 assigned to Schering AG ; and in the treatment of prostate diseases, WO 99/02161 assigned to Porssmann and WO 99/02161 assigned to Stief.

10 In accordance with the above descriptions, it will be understood that the compounds of Formula (1.0.0) are useful in the beneficial treatment of any one or more members selected from the group consisting of the following diseases, disorders, and conditions:

– asthma of whatever type, etiology, or pathogenesis; or asthma that is a member selected from the group consisting of atopic asthma; non-atopic asthma; allergic asthma; atopic, bronchial, IgE-mediated asthma; bronchial asthma; essential asthma; true asthma;
15 intrinsic asthma caused by pathophysiologic disturbances; extrinsic asthma caused by environmental factors; essential asthma of unknown or inapparent cause; non-atopic asthma; bronchitic asthma; emphysematous asthma; exercise-induced asthma; occupational asthma; infective asthma caused by bacterial, fungal, protozoal, or viral infection; non-allergic asthma; incipient asthma; wheezy infant syndrome;

20 – chronic or acute bronchoconstriction; chronic bronchitis; small airways obstruction; and emphysema;

– obstructive or inflammatory airways diseases of whatever type, etiology, or pathogenesis; or an obstructive or inflammatory airways disease that is a member selected from the group consisting of asthma; pneumoconiosis; chronic eosinophilic pneumonia;
25 chronic obstructive pulmonary disease (COPD); COPD that includes chronic bronchitis, pulmonary emphysema or dyspnea associated therewith; COPD that is characterized by irreversible, progressive airways obstruction; adult respiratory distress syndrome (ARDS), and exacerbation of airways hyper-reactivity consequent to other drug therapy;

– pneumoconiosis of whatever type, etiology, or pathogenesis; or pneumoconiosis
30 that is a member selected from the group consisting of aluminosis or bauxite workers' disease; anthracosis or miners' asthma; asbestosis or steam-fitters' asthma; chalicosis or flint disease; ptilosis caused by inhaling the dust from ostrich feathers; siderosis caused by the inhalation of iron particles; silicosis or grinders' disease; byssinosis or cotton-dust asthma; and talc pneumoconiosis;

- 162 -

- bronchitis of whatever type, etiology, or pathogenesis; or bronchitis that is a member selected from the group consisting of acute bronchitis; acute laryngotracheal bronchitis; arachidic bronchitis; catarrhal bronchitis; croupus bronchitis; dry bronchitis; infectious asthmatic bronchitis; productive bronchitis; staphylococcus or streptococcal bronchitis; and vesicular bronchitis;
- 5
- bronchiectasis of whatever type, etiology, or pathogenesis; or bronchiectasis that is a member selected from the group consisting of cylindric bronchiectasis; sacculated bronchiectasis; fusiform bronchiectasis; capillary bronchiectasis; cystic bronchiectasis; dry bronchiectasis; and follicular bronchiectasis;
- 10
- seasonal allergic rhinitis; or perennial allergic rhinitis; or sinusitis of whatever type, etiology, or pathogenesis; or sinusitis that is a member selected from the group consisting of purulent or nonpurulent sinusitis; acute or chronic sinusitis; and ethmoid, frontal, maxillary, or sphenoid sinusitis;
- rheumatoid arthritis of whatever type, etiology, or pathogenesis; or rheumatoid
- 15 arthritis that is a member selected from the group consisting of acute arthritis; acute gouty arthritis; chronic inflammatory arthritis; degenerative arthritis; infectious arthritis; Lyme arthritis; proliferative arthritis; psoriatic arthritis; and vertebral arthritis;
- gout, and fever and pain associated with inflammation;
- an eosinophil-related disorder of whatever type, etiology, or pathogenesis; or an
- 20 eosinophil-related disorder that is a member selected from the group consisting of eosinophilia; pulmonary infiltration eosinophilia; Löffler's syndrome; chronic eosinophilic pneumonia; tropical pulmonary eosinophilia; bronchopneumonic aspergillosis; aspergilloma; granulomas containing eosinophils; allergic granulomatous angiitis or Churg-Strauss syndrome; polyarteritis nodosa (PAN); and systemic necrotizing vasculitis;
- 25
- atopic dermatitis; or allergic dermatitis; or allergic or atopic eczema;
- urticaria of whatever type, etiology, or pathogenesis; or urticaria that is a member selected from the group consisting of immune-mediated urticaria; complement-mediated urticaria; urticariogenic material-induced urticaria; physical agent-induced urticaria; stress-induced urticaria; idiopathic urticaria; acute urticaria; chronic urticaria; angioedema;
- 30 cholinergic urticaria; cold urticaria in the autosomal dominant form or in the acquired form; contact urticaria; giant urticaria; and papular urticaria;
- conjunctivitis of whatever type, etiology, or pathogenesis; or conjunctivitis that is a member selected from the group consisting of actinic conjunctivitis; acute catarrhal conjunctivitis; acute contagious conjunctivitis; allergic conjunctivitis; atopic conjunctivitis;
- 35 chronic catarrhal conjunctivitis; purulent conjunctivitis; and vernal conjunctivitis;

- 163 -

- uveitis of whatever type, etiology, or pathogenesis; or uveitis that is a member selected from the group consisting of inflammation of all or part of the uvea; anterior uveitis; iritis; cyclitis; iridocyclitis; granulomatous uveitis; nongranulomatous uveitis; phacoantigenic uveitis; posterior uveitis; choroiditis; and chorioretinitis;
- 5 – psoriasis;
- multiple sclerosis of whatever type, etiology, or pathogenesis; or multiple sclerosis that is a member selected from the group consisting of primary progressive multiple sclerosis; and relapsing remitting multiple sclerosis;
- autoimmune/inflammatory diseases of whatever type, etiology, or pathogenesis; or
- 10 an autoimmune/inflammatory disease that is a member selected from the group consisting of autoimmune hematological disorders; hemolytic anemia; aplastic anemia; pure red cell anemia; idiopathic thrombocytopenic purpura; systemic lupus erythematosus; polychondritis; scleroderma; Wegner's granulomatosis; dermatomyositis; chronic active hepatitis; myasthenia
- 15 gravis; Stevens-Johnson syndrome; idiopathic sprue; autoimmune inflammatory bowel diseases; ulcerative colitis; Crohn's disease; endocrin opthamopathy; Grave's disease; sarcoidosis; alveolitis; chronic hypersensitivity pneumonitis; primary biliary cirrhosis; juvenile diabetes or diabetes mellitus type I; anterior uveitis; granulomatous or posterior uveitis; keratoconjunctivitis sicca; epidemic keratoconjunctivitis; diffuse interstitial pulmonary fibrosis or interstitial lung fibrosis; idiopathic pulmonary fibrosis; cystic fibrosis; psoriatic arthritis;
- 20 glomerulonephritis with and without nephrotic syndrome; acute glomerulonephritis; idiopathic nephrotic syndrome; minimal change nephropathy; inflammatory/hyperproliferative skin diseases; psoriasis; atopic dermatitis; contact dermatitis; allergic contact dermatitis; benign familial pemphigus; pemphigus erythematosus; pemphigus foliaceus; and pemphigus vulgaris;
- 25 – prevention of allogeneic graft rejection following organ transplantation;
- inflammatory bowel disease (IBD) of whatever type, etiology, or pathogenesis; or inflammatory bowel disease that is a member selected from the group consisting of ulcerative colitis (UC); collagenous colitis; colitis polyposa; transmural colitis; and Crohn's disease (CD);
- septic shock of whatever type, etiology, or pathogenesis; or septic shock that is a
- 30 member selected from the group consisting of renal failure; acute renal failure; cachexia; malarial cachexia; hypophysial cachexia; uremic cachexia; cardiac cachexia; cachexia suprarenalis or Addison's disease; cancerous cachexia; and cachexia as a consequence of infection by the human immunodeficiency virus (HIV);
- liver injury;
- 35 – pulmonary hypertension; and hypoxia-induced pulmonary hypertension;

- 164 -

– bone loss diseases; primary osteoporosis; and secondary osteoporosis;

– central nervous system disorders of whatever type, etiology, or pathogenesis; or a central nervous system disorder that is a member selected from the group consisting of depression; Parkinson's disease; learning and memory impairment; tardive dyskinesia; drug dependence; arteriosclerotic dementia; and dementias that accompany Huntington's chorea, Wilson's disease, paralysis agitans, and thalamic atrophies;

– infection, especially infection by viruses wherein such viruses increase the production of TNF- α in their host, or wherein such viruses are sensitive to upregulation of TNF- α in their host so that their replication or other vital activities are adversely impacted, including a virus which is a member selected from the group consisting of HIV-1, HIV-2, and HIV-3; cytomegalovirus, CMV; influenza; adenoviruses; and Herpes viruses, including *Herpes zoster* and *Herpes simplex*;

– yeast and fungus infections wherein said yeast and fungi are sensitive to upregulation by TNF- α or elicit TNF- α production in their host, e.g., fungal meningitis; particularly when administered in conjunction with other drugs of choice for the treatment of systemic yeast and fungus infections, including but are not limited to, polymyxins, e.g., Polymycin B; imidazoles, e.g., clotrimazole, econazole, miconazole, and ketoconazole; triazoles, e.g., fluconazole and itranazole; and amphotericins, e.g., Amphotericin B and liposomal Amphotericin B; and

– ischemia-reperfusion injury; autoimmune diabetes; retinal autoimmunity; chronic lymphocytic leukemia; HIV infections; lupus erythematosus; kidney and ureter disease; urogenital and gastrointestinal disorders; and prostate diseases.

DETAILED DESCRIPTION OF THE INVENTION**9.0 Combination with Other Drugs and Therapies**

The present invention contemplates embodiments in which a compound of Formula (1.0.0) is the only therapeutic agent which is employed in a method of treatment described herein, whether used alone or more commonly, together with a pharmaceutically acceptable carrier to produce a suitable dosage form for administration to a patient. Other embodiments of the present invention contemplate a combination of a compound of Formula (1.0.0) together with one or more additional therapeutic agents to be co-administered to a patient to obtain some particularly desired therapeutic end result. The second, *etc.* therapeutic agent may also be one or more compounds of Formula (1.0.0), or one or more PDE4 inhibitors known in the art and described in detail herein. More typically, the second, *etc.* therapeutic agent will be selected from a different class of therapeutic agents. These selections are described in detail below.

As used herein, the terms "co-administration", "co-administered", and "in combination with", referring to the compounds of Formula (1.0.0) and one or more other therapeutic agents, is intended to mean, and does refer to and include the following: (a) simultaneous administration of such combination of compound(s) and therapeutic agent(s) to a patient in need of treatment, when such components are formulated together into a single dosage form which releases said components at substantially the same time to said patient; (b) substantially simultaneous administration of such combination of compound(s) and therapeutic agent(s) to a patient in need of treatment, when such components are formulated apart from each other into separate dosage forms which are ingested at substantially the same time by said patient, whereupon said components are released at substantially the same time to said patient; (c) sequential administration of such combination of compound(s) and therapeutic agent(s) to a patient in need of treatment, when such components are formulated apart from each other into separate dosage forms which are ingested at consecutive times by said patient with a significant time interval between each ingestion, whereupon said components are released at substantially different times to said patient; and (d) sequential administration of such combination of compound(s) and therapeutic agent(s) to a patient in need of treatment, when such components are formulated together into a single dosage form which releases said components in a controlled manner whereupon they are concurrently, consecutively, and/or overlappingly ingested at the same and/or different times by said patient.

9.1 With Leukotriene Biosynthesis Inhibitors: 5-Lipoxygenase (5-LO) Inhibitors and 5-Lipoxygenase Activating Protein (FLAP) Antagonists

One or more compounds of Formula (1.0.0) is used in combination with leukotriene biosynthesis inhibitors, *i.e.*, 5-lipoxygenase inhibitors and/or 5-lipoxygenase activating protein antagonists, to form embodiments of the present invention. As already adverted to above, 5-

lipoxygenase (5-LO) is one of two groups of enzymes that metabolize arachidonic acid, the other group being the cyclooxygenases, COX-1 and COX-2. The 5-lipoxygenase activating protein is an 18 kDa membrane-bound, arachidonate-binding protein which stimulates the conversion of cellular arachidonic acid by 5-lipoxygenase. The arachidonic acid is converted
5 into 5-hydroperoxyeicosatetraenoic acid (5-HPETE), and this pathway eventually leads to the production of inflammatory leukotrienes; consequently, blocking the 5-lipoxygenase activating protein or the 5-lipoxygenase enzyme itself provides a desirable target for beneficially interfering with that pathway. One such 5-lipoxygenase inhibitor is zileuton represented by Formula (0.1.14), which may be found both above and following. Among the classes of
10 leukotriene synthesis inhibitors which are useful for forming therapeutic combinations with the compounds of Formula (1.0.0) are the following:

(a) redox-active agents which include *N*-hydroxyureas; *N*-alkylhydroxamic acids; selenite; hydroxybenzofurans; hydroxylamines; and catechols; see Ford-Hutchinson *et al.*, "5-Lipoxygenase," *Ann. Rev. Biochem.* 63 383-417, 1994; Weitzel and Wendel, "Selenoenzymes
15 regulate the activity of leukocyte 5-lipoxygenase via the peroxide tone," *J. Biol. Chem.* 268 6288-92, 1993; Björnstedt *et al.* "Selenite incubated with NADPH and mammalian thioredoxin reductase yields selenide, which inhibits lipoxygenase and changes the electron spin resonance spectrum of the active site iron," *Biochemistry* 35 8511-6, 1996; and Stewart *et al.*, "Structure-activity relationships of *N*-hydroxyurea 5-lipoxygenase inhibitors," *J. Med. Chem.*
20 40 1955-68, 1997;

(b) alkylating agents and compounds which react with SH groups have been found to inhibit leukotriene synthesis *in vitro*; see Larsson *et al.*, "Effects of 1-chloro-2,4,6-trinitrobenzene on 5-lipoxygenase activity and cellular leukotriene synthesis," *Biochem. Pharmacol.* 55 863-71, 1998; and

25 (c) competitive inhibitors of 5-lipoxygenase, based on thiopyranoindole and methoxyalkyl thiazole structures which may act as non-redox inhibitors of 5-lipoxygenase; see Ford-Hutchinson *et al.*, *Ibid.*; and Hamel *et al.*, "Substituted (pyridylmethoxy)naphthalenes as potent and orally active 5-lipoxygenase inhibitors - synthesis, biological profile, and pharmacokinetics of L-739,010," *J. Med. Chem.* 40 2866-75, 1997.

30 The observation that arachidonoyl hydroxamate inhibits 5-lipoxygenase has led to the discovery of clinically useful selective 5-lipoxygenase inhibitors such as the *N*-hydroxyurea derivatives zileuton and ABT-761, represented by Formulas (0.1.14) and (5.2.1):

- 167 -

Zileuton

ABT-761

(0.1.14)

(5.2.1)

Another *N*-hydroxyurea compound is fenleuton (Abbott-76745) which is represented
 5 by Formula (5.2.2):

Fenleuton

(5.2.2)

Zileuton is covered by US 4,873,259 (Summers *et al.*) assigned to Abbott
 Laboratories, which discloses indole, benzofuran, and benzothiophene containing
 10 lipoxigenase inhibiting compounds which may be represented by Formula (5.2.3):

(5.2.3)

where R_1 is H; (C₁-C₄) alkyl; (C₂-C₄) alkenyl; or NR₂R³ where R₂ and R₃ are H; (C₁-C₄) alkyl;
 or OH; X is O; S; SO₂; or NR₄ where R₄ is H; (C₁-C₆) alkyl; (C₁-C₆) alkanoyl; aroyl; or
 15 alkylsulfonyl; A is (C₁-C₆) alkylene; or (C₂-C₆) alkenylene; n is 1-5; and Y is H; halo; OH; CN;
 halo substituted alkyl; (C₁-C₁₂) alkyl; (C₂-C₁₂) alkenyl; (C₁-C₁₂) alkoxy; (C₃-C₈) cycloalkyl;
 (C₁-C₈) thioalkyl; aryl; aryloxy; aroyl; (C₁-C₁₂) arylalkyl; (C₂-C₁₂) arylalkenyl;
 (C₁-C₁₂) arylalkoxy; (C₁-C₁₂) arylthioalkoxy; or substituted derivatives of aryl; aryloxy; aroyl;
 (C₁-C₁₂) arylalkyl; (C₂-C₁₂) arylalkenyl; (C₁-C₁₂) arylalkoxy; (C₁-C₁₂) arylthioalkoxy; where said
 20 substituent is halo; NO₂; CN; or (C₁-C₁₂) -alkyl -alkoxy and -halosubstitutedalkyl; Z is O or S;
 and M is H; pharmaceutically acceptable cation; aroyl; or (C₁-C₁₂) alkanoyl.

Related compounds are disclosed in US 4,769,387 (Summers *et al.*); US 4,822,811
 (Summers); US 4,822,809 (Summers and Stewart); US 4,897,422 (Summers); US 4,992,464

- 168 -

(Summers *et al.*); and US 5,250,565 (Brooks and Summers); each of which is incorporated herein by reference in its entirety as though fully set out herein.

Zileuton or any of the above-described derivatives thereof are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

- 5 Fenleuton is disclosed in US 5,432,194; US 5,446,062; US 5,484,786; US 5,559,144; US 5,616,596; US 5,668,146; US 5,668,150; US 5,843,968; US 5,407,959; US 5,426,111; US 5,446,055; US 5,475,009; US 5,512,581; US 5,516,795; US 5,476,873; US 5,714,488; US 5,783,586; US 5,399,699; US 5,420,282; US 5,459,150; and US 5,506,261; each of which is incorporated herein by reference in its entirety as though fully set out herein. Further descriptions of such *N*-hydroxyurea and related inhibitors of 5-lipoxygenase and the synthesis of inflammatory leukotrienes may be found in WO 95/30671; WO 96/02507; WO 97/12865; WO 97/12866; WO 97/12867; WO 98/04555; and WO 98/14429.

- 15 Tepoxalin is a dual COX/5-LO inhibitor with short-lived *in vivo* activity that has led to the development of two series of hybrid compounds which are *N*-hydroxyureas and hydroxamic acids of Formulas (5.2.4) and (5.2.5), respectively:

(5.2.4)

(5.2.5)

- 20 where R¹ through R⁴ are H; Cl; CH₃; ethyl; *iso*-propyl; or *n*-propyl; or R³ and R⁴ together are (CH₂)₆ or (CH₂)₂O(CH₂)₂; and R⁵ is methyl; ethyl; *iso*-propyl; methoxy; trifluoromethyl; chloromethyl; ethyl propionate; phenyl; 2-furyl; 3-pyridyl; or 4-pyridyl. See Connolly *et al.*, "N-Hydroxyurea and hydroxamic acid inhibitors of cyclooxygenase and 5-lipoxygenase," *Bioorganic & Medicinal Chemistry Letters* 9 979-984, 1999.

Another *N*-hydroxyurea compound is Abbott-79175 which is represented by Formula (5.2.6):

- 169 -

Abbott-79175

(5.2.6)

Abbott-79175 has a longer duration of action than zileuton; Brooks *et al.*, *J. Pharm. Exp. Therapeut.* 272 724, 1995.

- 5 A still further *N*-hydroxyurea compound is Abbott-85761 which is represented by Formula (5.2.7):

Abbott-85761

(5.2.7)

- Abbott-85761 is delivered to the lung by aerosol administration of a homogeneous,
10 physically stable and nearly monodispersed formulation; Gupta *et al.*, "Pulmonary delivery of the 5-lipoxygenase inhibitor, Abbott-85761, in beagle dogs," *International Journal of Pharmaceutics* 147 207-218, 1997.

- Fenleuton, Abbott-79175, Abbott-85761 or any of the above-described derivatives thereof or of tepoxalin, are combined with the compounds of Formula (1.0.0) to form
15 embodiments of the present invention.

- Since the elucidation of the 5-LO biosynthetic pathway, there has been an ongoing debate as to whether it is more advantageous to inhibit the 5-lipoxygenase enzyme or to antagonize peptido- or non-peptido leukotriene receptors. Inhibitors of 5-lipoxygenase are deemed to be superior to LT-receptor antagonists, since 5-lipoxygenase inhibitors block the
20 action of the full spectrum of 5-LO products, whereas LT-antagonists produce narrower effects. Nevertheless, embodiments of the present invention include combinations of the compounds of Formula (1.0.0) with LT-antagonists as well as 5-LO inhibitors, as described below. Inhibitors of 5-lipoxygenase having chemical structures that differ from the classes of *N*-hydroxyureas and hydroxamic acids described above are also used in combination with the
25 compounds of Formula (1.0.0) to form further embodiments of the present invention. An example of such a different class is the *N*-(5-substituted)-thiophene-2-alkylsulfonamides of Formula (5.2.8):

- 170 -

(5.2.8)

where X is O or S; R' is methyl, *iso*-propyl, *n*-butyl, *n*-octyl, or phenyl; and R is *n*-pentyl, cyclohexyl, phenyl, tetrahydro-1-naphthyl, 1- or 2-naphthyl, or phenyl mono- or di-substituted by Cl, F, Br, CH₃, OCH₃, SCH₃, SO₂CH₃, CF₃, or *iso*-propyl. A preferred compound is that of Formula (5.2.9):

(5.2.9)

A further description of these compounds may be found in Beers *et al.*, "N-(5-substituted) thiophene-2-alkylsulfonamides as potent inhibitors of 5-lipoxygenase," *Bioorganic & Medicinal Chemistry* 5(4) 779-786, 1997.

Another distinct class of 5-lipoxygenase inhibitors is that of the 2,6-di-*tert*-butylphenol hydrazones described in Cuadro *et al.*, "Synthesis and biological evaluation of 2,6-di-*tert*-butylphenol hydrazones as 5-lipoxygenase inhibitors," *Bioorganic & Medicinal Chemistry* 6 173-180, 1998. Compounds of this type are represented by Formula (5.2.10):

(5.2.10)

where "Het" is benzoxazol-2-yl; benzothiazol-2-yl; pyridin-2-yl; pyrazin-2-yl; pyrimidin-2-yl; 4-phenylpyrimidin-2-yl; 4,6-diphenylpyrimidin-2-yl; 4-methylpyrimidin-2-yl; 4,6-dimethylpyrimidin-2-yl; 4-butylpyrimidin-2-yl; 4,6-dibutylpyrimidin-2-yl; and 4-methyl-6-phenylpyrimidin-2-yl.

The N-(5-substituted)-thiophene-2-alkylsulfonamides of Formula (5.2.8), or the 2,6-di-*tert*-butylphenol hydrazones of Formula (5.2.10), or any of the above-described derivatives thereof, are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

- 171 -

A further distinct class of 5-lipoxygenase inhibitors is that of methoxytetrahydropyrans to which Zeneca ZD-2138 belongs. ZD-2138 is represented by Formula (5.2.11):

(5.2.11)

- 5 ZD-2138 is highly selective and highly active orally in a number of species and has been evaluated in the treatment of asthma and rheumatoid arthritis by oral administration. Further details concerning ZD-2138 and derivatives thereof are disclosed in *Crawley et al., J. Med. Chem.*, 35 2600, 1992; and *Crawley et al., J. Med. Chem.* 36 295, 1993.

- 10 Another distinct class of 5-lipoxygenase inhibitors is that to which the SmithKline Beecham compound SB-210661 belongs. SB-210661 is represented by Formula (5.2.12):

(5.2.12)

- 15 Two further distinct and related classes of 5-lipoxygenase inhibitors comprise a series of pyridinyl-substituted 2-cyanonaphthalene compounds and a series of 2-cyanoquinoline compounds discovered by Merck Frosst. These two classes of 5-lipoxygenase inhibitors are exemplified by L-739,010 and L-746,530, represented by Formulas (5.2.13) and (5.2.14) respectively:

L-739,010

L-746,530

- 172 -

(5.2.13)

(5.2.14)

Details concerning L-739,010 and L-746,530 are disclosed in Dubé *et al.*, "Quinolines as potent 5-lipoxygenase inhibitors: synthesis and biological profile of L-746,530," *Bioorganic & Medicinal Chemistry* 8 1255-1260, 1998; and in WO 95/03309 (Friesen *et al.*).

5 The class of methoxytetrahydropyrans including Zeneca ZD-2138 of Formula (5.2.11); or the lead compound SB-210661 of Formula (5.2.12) and the class to which it belongs; or the series of pyridinyl-substituted 2-cyanonaphthalene compounds to which L-739,010 belongs, or the series of 2-cyanoquinoline compounds to which L-746,530 belongs; or any of the above-described derivatives of any of the above-mentioned classes, are
10 combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

In addition to the 5-lipoxygenase enzyme, the other endogenous agent which plays a significant role in the biosynthesis of the leukotrienes is the 5-lipoxygenase activating protein (FLAP). This role is an indirect one, in contrast to the direct role of the 5-lipoxygenase
15 enzyme. Nevertheless, antagonists of the 5-lipoxygenase activating protein are employed to inhibit the cellular synthesis of leukotrienes, and as such are also used in combination with the compounds of Formula (1.0.0) to form embodiments of the present invention.

Compounds which bind to the 5-lipoxygenase activating protein and thereby block utilization of the endogenous pool of arachidonic acid which is present have been synthesized
20 from indole and quinoline structures; see Ford-Hutchinson *et al.*, *ibid.*; Rouzer *et al.* "MK-886, a potent and specific leukotriene biosynthesis inhibitor blocks and reverses the membrane association of 5-lipoxygenase in ionophore-challenged leukocytes," *J. Biol. Chem.* 265 1436-42, 1990; and Gorenne *et al.*, "{(R)-2-quinolin-2-yl-methoxy}phenyl)-2-cyclopentyl acetic acid} (BAY x1005), a potent leukotriene synthesis inhibitor: effects on anti-IgE challenge in human
25 airways," *J. Pharmacol. Exp. Ther.* 268 868-72, 1994

MK-591, which has been designated quiflipon sodium, is represented by Formula (5.2.15):

- 173 -

(5.2.15)

The above-mentioned indole and quinoline classes of compounds and the specific compounds MK-591, MK-886, and BAY x 1005 to which they belong, or any of the above-described derivatives of any of the above-mentioned classes, are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

9.2 With Receptor Antagonists for Leukotrienes LTB₄, LTC₄, LTD₄, and LTE₄

One or more compounds of Formula (1.0.0) is used in combination with receptor antagonists for leukotrienes LTB₄, LTC₄, LTD₄, and LTE₄. The most significant of these leukotrienes in terms of mediating inflammatory response, are LTB₄ and LTD₄. Classes of antagonists for the receptors of these leukotrienes are described in the paragraphs which follow.

4-Bromo-2,7-dimethoxy-3H-phenothiazin-3-ones, including L-651,392, are potent receptor antagonists for LTB₄ that are described in US 4,939,145 (Guindon *et al.*) and US 4,845,083 (Lau *et al.*). L-651,392 is represented by Formula (5.2.16):

L-651,392

(5.2.16)

A class of amidino compounds that includes CGS-25019c is described in US 5,451,700 (Morrissey and Suh); US 5,488,160 (Morrissey); and US 5,639,768 (Morrissey and Suh). These receptor antagonists for LTB₄ are typified by CGS-25019c, which is represented by Formula (5.2.17):

- 174 -

CGS-25019c

(5.2.17)

Ontazolast, a member of a class of benzoxalamines that are receptor antagonists for LTB_4 , is described in EP 535 521 (Anderskewitz *et al.*); and is represented by Formula

5 (5.2.18):

Ontazolast

(5.2.18)

The same group of workers has also discovered a class of benzenecarboximidamides which are receptor antagonists for LTB_4 , described in WO 97/21670 (Anderskewitz *et al.*); and WO 98/11119 (Anderskewitz *et al.*); and which are typified by BIIL 284/260, represented by Formula (5.2.19):

10

BIIL 284/260

(5.2.19)

Zafirlukast is a receptor antagonist for LTC_4 , LTD_4 , and LTE_4 which is sold commercially under the name Accolate®. It belongs to a class of heterocyclic amide derivatives described in US 4,859,692 (Bernstein *et al.*); US 5,319,097 (Holohan and Edwards); US 5,294,636 (Edwards and Sherwood); US 5,482,963; US 5,583,152 (Bernstein *et al.*); and US 5,612,367 (Timko *et al.*). Zafirlukast is represented by Formula (5.2.20):

15

- 175 -

Zafirlukast

(5.2.20)

Ablukast is a receptor antagonist for LTD₄ that is designated Ro 23-3544/001, and is represented by Formula (5.2.21):

Ablukast

(5.2.21)

Montelukast is a receptor antagonist for LTD₄ which is sold commercially under the name Singulair® and is described in US 5,565,473. Montelukast is represented by Formula (5.2.22):

Montelukast

(5.2.22)

Other receptor antagonists for LTD₄ include pranlukast, verlukast (MK-679), RG-12525, Ro-245913, iralukast (CGP 45715A), and BAY x 7195.

The above-mentioned phenothiazin-3-one class of compounds, including L-651,392; the class of amidino compounds that includes CGS-25019c; the class of benzoxalamines which includes Ontazolast; the class of benzenecarboximidamides which is typified by BIL 284/260; the heterocyclic amide derivatives including Zafirlukast; Ablukast and Montelukast and the classes of compounds to which they belong; or any of the above-described derivatives of any of the above-mentioned classes, are combined with the compounds of Formula (1.0.0) to form embodiments of the present invention.

9.3 With Other Therapeutic Agents to Form Further Combinations

- One or more compounds of Formula (1.0.0) are used together with other therapeutic agents as well as non-therapeutic agents to form combinations that are further embodiments of the present invention and that are useful in the treatment of a significant number of different diseases, disorders, and conditions described herein. Said embodiments comprise one or more compounds of Formula (1.0.0) together with one or more of the following:
- (a) PDE4 inhibitors including inhibitors of the isoform PDE4D;
 - (b) 5-Lipoxygenase (5-LO) inhibitors; or 5-lipoxygenase activating protein (FLAP) antagonists;
 - 10 (c) Dual inhibitors of 5-lipoxygenase (5-LO) and antagonists of platelet activating factor (PAF);
 - (d) Leukotriene antagonists (LTRAs) including antagonists of LTB₄, LTC₄, LTD₄, and LTE₄;
 - (e) Antihistaminic H₁ receptor antagonists including cetirizine, loratadine, desloratadine, fexofenadine, astemizole, azelastine, and chlorpheniramine;
 - 15 (f) Gastroprotective H₂ receptor antagonists;
 - (g) α_1 - and α_2 -adrenoceptor agonist vasoconstrictor sympathomimetic agents administered orally or topically for decongestant use, including propylhexedrine, phenylephrine, phenylpropanolamine, pseudoephedrine, naphazoline hydrochloride, oxymetazoline hydrochloride, tetrahydrozoline hydrochloride, xylometazoline hydrochloride, and
 - 20 ethylnorepinephrine hydrochloride;
 - (h) α_1 - and α_2 -adrenoceptor agonists in combination with inhibitors of 5-lipoxygenase (5-LO);
 - (i) Anticholinergic agents including ipratropium bromide;
 - (j) β_1 - to β_4 -adrenoceptor agonists including isoprenaline, albuterol, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol mesylate, and pirbuterol;
 - 25 (k) Theophylline and aminophylline;
 - (l) Sodium cromoglycate;
 - (m) Muscarinic receptor (M1, M2, and M3) antagonists;
 - (n) COX-1 inhibitors (NSAIDs); COX-2 selective inhibitors including rofecoxib; and nitric oxide
 - 30 NSAIDs;
 - (o) Insulin-like growth factor type I (IGF-1) mimetics;
 - (p) Ciclesonide;

- 177 -

- (q) Inhaled glucocorticoids with reduced systemic side effects, including flunisolide, triamcinolone acetonide, beclomethasone dipropionate, budesonide, fluticasone propionate, and mometasone furoate;
- (r) Tryptase inhibitors;
- 5 (s) Platelet activating factor (PAF) antagonists;
- (t) Monoclonal antibodies against endogenous inflammatory entities;
- (u) IPL 576;
- (v) Anti-tumor necrosis factor (TNF α) agents including Etanercept, Infliximab, and D2E7;
- (w) DMARDs including Leflunomide;
- 10 (x) TCR peptides;
- (y) Interleukin converting enzyme (ICE) inhibitors;
- (z) IMPDH inhibitors;
- (aa) Adhesion molecule inhibitors including VLA-4 antagonists;
- (bb) Cathepsins;
- 15 (cc) MAP kinase inhibitors;
- (dd) Glucose-6 phosphate dehydrogenase inhibitors;
- (ee) Kinin-B₁ - and B₂ -receptor antagonists;
- (ff) Gold in the form of an aurothio group together with various hydrophilic groups;
- (gg) Immunosuppressive agents, e.g., cyclosporine, azathioprine, and methotrexate;
- 20 (hh) Anti-gout agents, e.g., colchicine;
- (ii) Xanthine oxidase inhibitors, e.g., allopurinol;
- (jj) Uricosuric agents, e.g., probenecid, sulfinpyrazone, and benzbromarone;
- (kk) Antineoplastic agents, especially antimitotic drugs including the vinca alkaloids such as vinblastine and vincristine;
- 25 (ll) Growth hormone secretagogues;
- (mm) Inhibitors of matrix metalloproteases (MMPs), i.e., the stromelysins, the collagenases, and the gelatinases, as well as aggrecanase; especially collagenase-1 (MMP-1), collagenase-2 (MMP-8), collagenase-3 (MMP-13), stromelysin-1 (MMP-3), stromelysin-2 (MMP-10), and stromelysin-3 (MMP-11);

- 178 -

(nn)Transforming growth factor (TGF β);

(oo)Platelet-derived growth factor (PDGF);

(pp)Fibroblast growth factor, e.g., basic fibroblast growth factor (bFGF);

(qq)Granulocyte macrophage colony stimulating factor (GM-CSF);

5 (rr) Capsaicin cream;

(ss)Anti-emetic agents including NK-1 receptor antagonists and D-4418; and

(tt) Anti-depressants.

DETAILED DESCRIPTION OF THE INVENTION

10 10.0 Pharmaceutical Compositions and Formulations

The description which follows concerns the manner in which the compounds of Formula (1.0.0), together with other therapeutic agents or non-therapeutic agents where these are desired, are combined with what are for the most part conventional pharmaceutically acceptable carriers to form dosage forms suitable for the different routes of administration which are utilized for any given patient, as well as appropriate to the disease, disorder, or condition for which any given patient is being treated.

The preferred routes of administration for the compounds of Formula (1.0.0) are by way of oral and aerosol formulations prepared and delivered in a conventional fashion. Detailed information regarding the preparation of such formulations and the manner in which they are to be given to a patient in need of treatment are discussed further below.

The pharmaceutical compositions of the present invention comprise any one or more of the above-described inhibitory compounds of the present invention, or a pharmaceutically acceptable salt thereof as also above-described, together with a pharmaceutically acceptable carrier in accordance with the properties and expected performance of such carriers which are well-known in the pertinent art.

The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated, and the particular mode of administration. It should be understood, however, that a specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating physician and the severity of the particular disease being treated. The amount of active ingredient may also depend upon the therapeutic or prophylactic agent, if any, with which the ingredient is co-administered.

The above-described compounds of the present invention may be utilized in the form of acids, esters, or other chemical classes of compounds to which the compounds described belong. It is also within the scope of the present invention to utilize those compounds in the form of pharmaceutically acceptable salts derived from various organic and inorganic acids and bases in accordance with procedures described in detail above and well known in the art. An active ingredient comprising a compound of Formula (1.0.0) is often utilized in the form of a salt thereof, especially where said salt form confers on said active ingredient improved pharmacokinetic properties as compared to the free form of said active ingredient or some other salt form of said active ingredient utilized previously. The pharmaceutically acceptable salt form of said active ingredient may also initially confer a desirable pharmacokinetic property on said active ingredient which it did not previously possess, and may even positively affect the pharmacodynamics of said active ingredient with respect to its therapeutic activity in the body.

The pharmacokinetic properties of said active ingredient which may be favorably affected include, e.g., the manner in which said active ingredient is transported across cell membranes, which in turn may directly and positively affect the absorption, distribution, biotransformation and excretion of said active ingredient. While the route of administration of the pharmaceutical composition is important, and various anatomical, physiological and pathological factors can critically affect bioavailability, the solubility of said active ingredient is usually dependent upon the character of the particular salt form thereof which it utilized. Further, as the artisan understands, an aqueous solution of said active ingredient will provide the most rapid absorption of said active ingredient into the body of a patient being treated, while lipid solutions and suspensions, as well as solid dosage forms, will result in less rapid absorption of said active ingredient. Oral ingestion of said active ingredient is the most preferred route of administration for reasons of safety, convenience, and economy, but absorption of such an oral dosage form can be adversely affected by physical characteristics such as polarity, emesis caused by irritation of the gastrointestinal mucosa, destruction by digestive enzymes and low pH, irregular absorption or propulsion in the presence of food or other drugs, and metabolism by enzymes of the mucosa, the intestinal flora, or the liver. Formulation of said active ingredient into different pharmaceutically acceptable salt forms may be effective in overcoming or alleviating one or more of the above-recited problems encountered with absorption of oral dosage forms.

Among the pharmaceutical salts recited further above, those which are preferred include, but are not limited to acetate, besylate, citrate, fumarate, gluconate, hemisuccinate, hippurate, hydrochloride, hydrobromide, isethionate, mandelate, meglumine, nitrate, oleate, phosphonate, pivalate, sodium phosphate, stearate, sulfate, sulfosalicylate, tartrate, thiomalate, tosylate, and tromethamine.

- 180 -

Multiple salts forms are included within the scope of the present invention where a compound of the present invention contains more than one group capable of forming such pharmaceutically acceptable salts. Examples of typical multiple salt forms include, but are not limited to bitartrate, diacetate, difumarate, dimeglumine, diphosphate, disodium, and trihydrochloride.

The pharmaceutical compositions of the present invention comprise any one or more of the above-described inhibitory compounds of the present invention, or a pharmaceutically acceptable salt thereof as also above-described, together with a pharmaceutically acceptable carrier in accordance with the properties and expected performance of such carriers which are well-known in the pertinent art.

The term "carrier" as used herein includes acceptable diluents, excipients, adjuvants, vehicles, solubilization aids, viscosity modifiers, preservatives and other agents well known to the artisan for providing favorable properties in the final pharmaceutical composition. In order to illustrate such carriers, there follows a brief survey of pharmaceutically acceptable carriers that may be used in the pharmaceutical compositions of the present invention, and thereafter a more detailed description of the various types of ingredients. Typical carriers include but are by no means limited to, ion exchange compositions; alumina; aluminum stearate; lecithin; serum proteins, e.g., human serum albumin; phosphates; glycine; sorbic acid; potassium sorbate; partial glyceride mixtures of saturated vegetable fatty acids; hydrogenated palm oils; water; salts or electrolytes, e.g., prolamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, and zinc salts; colloidal silica; magnesium trisilicate; polyvinyl pyrrolidone; cellulose-based substances; e.g., sodium carboxymethylcellulose; polyethylene glycol; polyacrylates; waxes; polyethylene-polyoxypropylene-block polymers; and wool fat.

More particularly, the carriers used in the pharmaceutical compositions of the present invention comprise various classes and species of additives which are members independently selected from the groups consisting essentially of those recited in the following paragraphs.

Acidifying and alkalizing agents are added to obtain a desired or predetermined pH and comprise acidifying agents, e.g., acetic acid, glacial acetic acid, malic acid, and propionic acid. Stronger acids such as hydrochloric acid, nitric acid and sulfuric acid may be used but are less preferred. Alkalizing agents include, e.g., edetol, potassium carbonate, potassium hydroxide, sodium borate, sodium carbonate, and sodium hydroxide. Alkalizing agents which contain active amine groups, such as diethanolamine and triethylamine, may also be used.

Aerosol propellants are required where the pharmaceutical composition is to be delivered as an aerosol under significant pressure. Such propellants include, e.g., acceptable

- 181 -

fluorochlorohydrocarbons such as dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane; nitrogen; or a volatile hydrocarbon such as butane, propane, isobutane or mixtures thereof.

Antimicrobial agents including antibacterial, antifungal and antiprotozoal agents are added where the pharmaceutical composition is topically applied to areas of the skin which are likely to have suffered adverse conditions or sustained abrasions or cuts which expose the skin to infection by bacteria, fungi or protozoa. Antimicrobial agents include such compounds as benzyl alcohol, chlorobutanol, phenylethyl alcohol, phenylmercuric acetate, potassium sorbate, and sorbic acid. Antifungal agents include such compounds as benzoic acid, butylparaben, ethylparaben, methylparaben, propylparaben, and sodium benzoate.

Antimicrobial preservatives are added to the pharmaceutical compositions of the present invention in order to protect them against the growth of potentially harmful microorganisms, which usually invade the aqueous phase, but in some cases can also grow in the oil phase of a composition. Thus, preservatives with both aqueous and lipid solubility are desirable. Suitable antimicrobial preservatives include, e.g., alkyl esters of *p*-hydroxybenzoic acid, propionate salts, phenoxyethanol, methylparaben sodium, propylparaben sodium, sodium dehydroacetate, benzalkonium chloride, benzethonium chloride, benzyl alcohol, hydantoin derivatives, quaternary ammonium compounds and cationic polymers, imidazolidinyl urea, diazolidinyl urea, and trisodium ethylenediamine tetracetate (EDTA). Preservatives are preferably employed in amounts ranging from about 0.01% to about 2.0% by weight of the total composition.

Antioxidants are added to protect all of the ingredients of the pharmaceutical composition from damage or degradation by oxidizing agents present in the composition itself or the use environment, e.g., anoxomer, ascorbyl palmitate, butylated hydroxyanisole, butylated hydroxytoluene, hypophosphorous acid, potassium metabisulfite, propyl octyl and dodecyl gallate, sodium metabisulfite, sulfur dioxide, and tocopherols.

Buffering agents are used to maintain a desired pH of a composition once established, from the effects of outside agents and shifting equilibria of components of the composition. The buffering may be selected from among those familiar to the artisan skilled in the preparation of pharmaceutical compositions, e.g., calcium acetate, potassium metaphosphate, potassium phosphate monobasic, and tartaric acid.

Chelating agents are used to help maintain the ionic strength of the pharmaceutical composition and bind to and effectively remove destructive compounds and metals, and include, e.g., edetate dipotassium, edetate disodium, and edetic acid.

Dermatologically active agents are added to the pharmaceutical compositions of the present invention where they are to be applied topically, and include, *e.g.*, wound healing agents such as peptide derivatives, yeast, panthenol, hexylresorcinol, phenol, tetracycline hydrochloride, lamin and kinetin; retinoids for treating skin cancer, *e.g.*, retinol, tretinoin, isotretinoin, etretinate, acitretin, and arotinoid; mild antibacterial agents for treating skin infections, *e.g.*, resorcinol, salicylic acid, benzoyl peroxide, erythromycin-benzoyl peroxide, erythromycin, and clindamycin; antifungal agents for treating tinea corporis, tinea pedis, candidiasis and tinea versicolor, *e.g.*, griseofulvin, azoles such as miconazole, econazole, itraconazole, fluconazole, and ketoconazole, and allylamines such as naftifine and terfenafine; antiviral agents for treating cutaneous herpes simplex, herpes zoster, and chickenpox, *e.g.*, acyclovir, famciclovir, and valacyclovir; antihistamines for treating pruritis, atopic and contact dermatitis, *e.g.*, diphenhydramine, terfenadine, astemizole, loratadine, cetirizine, acrivastine, and temelastine; topical anesthetics for relieving pain, irritation and itching, *e.g.*, benzocaine, lidocaine, dibucaine, and pramoxine hydrochloride; topical analgesics for relieving pain and inflammation, *e.g.*, methyl salicylate, camphor, menthol, and resorcinol; topical antiseptics for preventing infection, *e.g.*, benzalkonium chloride and povidone-iodine; and vitamins and derivatives thereof such as tocopherol, tocopherol acetate, retinoic acid and retinol.

Dispersing and suspending agents are used as aids for the preparation of stable formulations and include, *e.g.*, poligeeenan, povidone, and silicon dioxide.

Emollients are agents, preferably non-oily and water-soluble, which soften and soothe the skin, especially skin that has become dry because of excessive loss of water. Such agents are used with pharmaceutical compositions of the present invention which are intended for topical applications, and include, *e.g.*, hydrocarbon oils and waxes, triglyceride esters, acetylated monoglycerides, methyl and other alkyl esters of C₁₀-C₂₀ fatty acids, C₁₀-C₂₀ fatty acids, C₁₀-C₂₀ fatty alcohols, lanolin and derivatives, polyhydric alcohol esters such as polyethylene glycol (200-600), polyoxyethylene sorbitan fatty acid esters, wax esters, phospholipids, and sterols; emulsifying agents used for preparing oil-in-water emulsions; excipients, *e.g.*, laurocapram and polyethylene glycol monomethyl ether; humectants, *e.g.*, sorbitol, glycerin and hyaluronic acid; ointment bases, *e.g.*, petrolatum, polyethylene glycol, lanolin, and poloxamer; penetration enhancers, *e.g.*, dimethyl isosorbide, diethyl-glycol-monoethylether, 1-dodecylazacycloheptan-2-one, and dimethylsulfoxide (DMSO); preservatives, *e.g.*, benzalkonium chloride, benzethonium chloride, alkyl esters of p-hydroxybenzoic acid, hydantoin derivatives, cetylpyridinium chloride, propylparaben, quaternary ammonium compounds such as potassium benzoate, and thimerosal; sequestering agents comprising cyclodextrins; solvents, *e.g.*, acetone, alcohol, amylene hydrate, butyl alcohol, corn oil, cottonseed oil, ethyl acetate, glycerin, hexylene glycol, isopropyl alcohol, isostearyl alcohol, methyl alcohol, methylene chloride, mineral oil, peanut

- 183 -

oil, phosphoric acid, polyethylene glycol, polyoxypropylene 15 stearyl ether, propylene glycol, propylene glycol diacetate, sesame oil, and purified water; stabilizers, e.g., calcium saccharate and thymol; surfactants, e.g., lauryl chloride; laureth 4, i.e., α -dodecyl- ω -hydroxy-poly(oxy-1,2-ethanediyl) or polyethylene glycol monododecyl ether.

5 Emulsifying agents, including emulsifying and stiffening agents and emulsion adjuncts, are used for preparing oil-in-water emulsions when these form the basis of the pharmaceutical compositions of the present invention. Such emulsifying agents include, e.g., non-ionic emulsifiers such as C_{10} - C_{20} fatty alcohols and said fatty alcohols condensed with
10 from 2 to 20 moles of ethylene oxide or propylene oxide, (C_6 - C_{12})alkyl phenols condensed with from 2 to 20 moles of ethylene oxide, mono- and di- C_{10} - C_{20} fatty acid esters of ethylene glycol, C_{10} - C_{20} fatty acid monoglyceride, diethylene glycol, polyethylene glycols of MW 200-6000, polypropylene glycols of MW 200-3000, and particularly sorbitol, sorbitan, polyoxyethylene sorbitol, polyoxyethylene sorbitan, hydrophilic wax esters, cetostearyl alcohol, oleyl alcohol, lanolin alcohols, cholesterol, mono- and di-glycerides, glyceryl
15 monostearate, polyethylene glycol monostearate, mixed mono- and distearic esters of ethylene glycol and polyoxyethylene glycol, propylene glycol monostearate, and hydroxypropyl cellulose. Emulsifying agents which contain active amine groups may also be used and typically include anionic emulsifiers such as fatty acid soaps, e.g., sodium, potassium and triethanolamine soaps of C_{10} - C_{20} fatty acids; alkali metal, ammonium or
20 substituted ammonium (C_{10} - C_{30})alkyl sulfates, (C_{10} - C_{30})alkyl sulfonates, and (C_{10} - C_{50})alkyl ethoxy ether sulfonates. Other suitable emulsifying agents include castor oil and hydrogenated castor oil; lecithin; and polymers of 2-propenoic acid together with polymers of acrylic acid, both cross-linked with allyl ethers of sucrose and/or pentaerythritol, having varying viscosities and identified by product names carbomer 910, 934, 934P, 940, 941, and
25 1342. Cationic emulsifiers having active amine groups may also be used, including those based on quaternary ammonium, morpholinium and pyridinium compounds. Similarly, amphoteric emulsifiers having active amine groups, such as cocobetaines, lauryl dimethylamine oxide and cocoylimidazoline, may be used. Useful emulsifying and stiffening agents also include cetyl alcohol and sodium stearate; and emulsion adjuncts such as oleic
30 acid, stearic acid, and stearyl alcohol.

Excipients include, e.g., laurocapram and polyethylene glycol monomethyl ether.

Where the pharmaceutical composition of the present invention is to be applied topically, penetration enhancers may be used, which include, e.g., dimethyl isosorbide, diethyl-glycol-monoethylether, 1-dodecylazacycloheptan-2-one, and dimethylsulfoxide
35 (DMSO). Such compositions will also typically include ointment bases, e.g., petrolatum,

- 184 -

polyethylene glycol, lanolin, and poloxamer, which is a block copolymer of polyoxyethylene and polyoxypropylene, which may also serve as a surfactant or emulsifying agent.

Preservatives are used to protect pharmaceutical compositions of the present invention from degradative attack by ambient microorganisms, and include, e.g.,
5 benzalkonium chloride, benzethonium chloride, alkyl esters of p-hydroxybenzoic acid, hydantoin derivatives, cetylpyridinium chloride, monothioglycerol, phenol, phenoxyethanol, methylparagen, imidazolidinyl urea, sodium dehydroacetate, propylparaben, quaternary ammonium compounds, especially polymers such as polixetonium chloride, potassium benzoate, sodium formaldehyde sulfoxylate, sodium propionate, and thimerosal.

10 Sequestering agents are used to improve the stability of the pharmaceutical compositions of the present invention and include, e.g., the cyclodextrins which are a family of natural cyclic oligosaccharides capable of forming inclusion complexes with a variety of materials, and are of varying ring sizes, those having 6-, 7- and 8-glucose residues in a ring being commonly referred to as α -cyclodextrins, β -cyclodextrins, and γ -cyclodextrins,
15 respectively. Suitable cyclodextrins include, e.g., α -cyclodextrin, β -cyclodextrin, γ -cyclodextrin, δ -cyclodextrin and cationized cyclodextrins.

Solvents which may be used in preparing the pharmaceutical compositions of the present invention include, e.g., acetone, alcohol, amylene hydrate, butyl alcohol, corn oil, cottonseed oil, ethyl acetate, glycerin, hexylene glycol, isopropyl alcohol, isostearyl alcohol,
20 methyl alcohol, methylene chloride, mineral oil, peanut oil, phosphoric acid, polyethylene glycol, polyoxypropylene 15 stearyl ether, propylene glycol, propylene glycol diacetate, sesame oil, and purified water.

Stabilizers which are suitable for use include, e.g., calcium saccharate and thymol.

Stiffening agents are typically used in formulations for topical applications in order to
25 provide desired viscosity and handling characteristics and include, e.g., cetyl esters wax, myristyl alcohol, parafin, synthetic parafin, emulsifying wax, microcrystalline wax, white wax and yellow wax.

Sugars are often used to impart a variety of desired characteristics to the pharmaceutical compositions of the present invention and in order to improve the results
30 obtained, and include, e.g., monosaccharides, disaccharides and polysaccharides such as glucose, xylose, fructose, reose, ribose, pentose, arabinose, allose, tallose, altrose, mannose, galactose, lactose, sucrose, erythrose, glyceraldehyde, or any combination thereof.

Surfactants are employed to provide stability for multi-component pharmaceutical compositions of the present invention, enhance existing properties of those compositions, and
35 bestow desirable new characteristics on said compositions. Surfactants are used as wetting

agents, antifoam agents, for reducing the surface tension of water, and as emulsifiers, dispersing agents and penetrants, and include, e.g., lauryl chloride; laureth 4, *i.e.*, α -dodecyl- ω -hydroxy-poly(oxy-1,2-ethanediyl) or polyethylene glycol monododecyl ether; laureth 9, *i.e.*, a mixture of polyethylene glycol monododecyl ethers averaging about 9
 5 ethylene oxide groups per molecule; monoethanolamine; nonoxynol 4, 9 and 10, *i.e.*, polyethylene glycol mono(*p*-nonylphenyl) ether; nonoxynol 15, *i.e.*, α -(*p*-nonylphenyl)- ω -hydroxypenta-deca(oxyethylene); nonoxynol 30, *i.e.*, α -(*p*-nonylphenyl)- ω -hydroxytriaconta(oxyethylene); poloxalene, *i.e.*, nonionic polymer of the polyethylene-polypropylene glycol type, MW = approx. 3000; poloxamer, referred to in the discussion of
 10 ointment bases further above; polyoxyl 8, 40 and 50 stearate, *i.e.*, poly(oxy-1,2-ethanediyl), α -hydro- ω -hydroxy-; octadecanoate; polyoxyl 10 oleyl ether, *i.e.*, poly(oxy-1,2-ethanediyl), α -[(*Z*)-9-octadecenyl- ω -hydroxy-; polysorbate 20, *i.e.*, sorbitan, monododecanoate, poly(oxy-1,2-ethanediyl); polysorbate 40, *i.e.*, sorbitan, monohexadecanoate, poly(oxy-1,2-ethanediyl); polysorbate 60, *i.e.*, sorbitan, monooctadecanoate, poly(oxy-1,2-ethanediyl); polysorbate 65,
 15 *i.e.*, sorbitan, trioctadecanoate, poly(oxy-1,2-ethanediyl); polysorbate 80, *i.e.*, sorbitan, mono-9-monodecenoate, poly(oxy-1,2-ethanediyl); polysorbate 85, *i.e.*, sorbitan, tri-9-octadecenoate, poly(oxy-1,2-ethanediyl); sodium lauryl sulfate; sorbitan monolaurate; sorbitan monooleate; sorbitan monopalmitate; sorbitan monostearate; sorbitan sesquioleate; sorbitan trioleate; and sorbitan tristearate.

20 The pharmaceutical compositions of the present invention may be prepared using very straightforward methodology which is well understood by the artisan of ordinary skill. Where the pharmaceutical compositions of the present invention are simple aqueous and/or other solvent solutions, the various components of the overall composition are brought together in any practical order, which will be dictated largely by considerations of
 25 convenience. Those components having reduced water solubility, but sufficient solubility in the same co-solvent with water, may all be dissolved in said co-solvent, after which the co-solvent solution will be added to the water portion of the carrier whereupon the solutes therein will become dissolved in the water. To aid in this dispersion/solution process, a surfactant may be employed.

30 Where the pharmaceutical compositions of the present invention are to be in the form of emulsions, the components of the pharmaceutical composition will be brought together in accordance with the following general procedures. The continuous water phase is first heated to a temperature in the range of from about 60° to about 95°C, preferably from about 70° to about 85°C, the choice of which temperature to use being dependent upon the physical
 35 and chemical properties of the components which make up the oil-in-water emulsion. Once the continuous water phase has reached its selected temperature, the components of the final

- 186 -

composition to be added at this stage are admixed with the water and dispersed therein under high-speed agitation. Next, the temperature of the water is restored to approximately its original level, after which the components of the composition which comprise the next stage are added to the composition mixture under moderate agitation and mixing continues for from about 5 to about 60 minutes, preferably about 10 to about 30 minutes, depending on the components of the first two stages. Thereafter, the composition mixture is passively or actively cooled to from about 20° to about 55°C for addition of any components in the remaining stages, after which water is added in sufficient quantity to reach its original predetermined concentration in the overall composition.

According to the present invention, the pharmaceutical compositions may be in the form of a sterile injectable preparation, for example a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or di-glycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as do natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as *Rh*, *HCIX* or similar alcohol.

The pharmaceutical compositions of the present invention may be orally administered in any orally acceptable dosage form including, but not limited to, capsules, tablets, aqueous suspensions or solutions. In the case of tablets for oral use, carriers which are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral administration in a capsule form, useful diluents include lactose and dried corn starch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, flavoring or coloring agents may also be added. Alternatively, the pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These can be prepared by mixing the agent with a suitable non-irritating excipient which is solid at room temperature but liquid at the rectal temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and polyethylene glycols.

The pharmaceutical compositions of the present invention may also be administered topically, especially when the target of treatment includes areas or organs readily accessible by topical application, including diseases of the eye, the skin, or the lower intestinal tract. Suitable topical formulations are readily prepared for each of these areas or organs.

- 5 Topical application for the lower intestinal tract can be effected in a rectal suppository formulation, as described above, or in a suitable enema formulation. Topically active transdermal patches may also be used.

- For topical applications, the pharmaceutical compositions may be formulated in a suitable ointment containing the active component suspended or dissolved in one or more
10 carriers. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene, polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical compositions can be formulated in a suitable lotion or cream containing the active components suspended or dissolved in one or more pharmaceutically acceptable
15 carriers. Suitable carriers include, but are not limited to, mineral oil, sorbitan monostearate, polysorbate, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

- Pharmaceutical compositions within the scope of the present invention include those wherein the therapeutically effective amount of an active ingredient comprising a compound of the present invention required for treating or preventing diseases, disorders, and conditions
20 mediated by or associated with modulation of PDE4, especially PDE4D activity as described herein, is provided in a dosage form suitable for systemic administration. Such a pharmaceutical composition will contain said active ingredient in suitable liquid form for delivery by: (1) injection or infusion which is intraarterial, intra- or transdermal, subcutaneous, intramuscular, intraspinal, intrathecal, or intravenous, wherein said active ingredient: (a) is
25 contained in solution as a solute; (b) is contained in the discontinuous phase of an emulsion, or the discontinuous phase of an inverse emulsion which inverts upon injection or infusion, said emulsions containing suitable emulsifying agents; or (c) is contained in a suspension as a suspended solid in colloidal or microparticulate form, said suspension containing suitable suspending agents; (2) injection or infusion into suitable body tissues or cavities as a depot,
30 wherein said composition provides storage of said active ingredient and thereafter delayed-, sustained-, and/or controlled-release of said active ingredient for systemic distribution; (3) instillation, inhalation or insufflation into suitable body tissues or cavities of said pharmaceutical composition in suitable solid form, where said active ingredient: (a) is
35 contained in a solid implant composition providing delayed-, sustained-, and/or controlled-release of said active ingredient; (b) is contained in a particulate composition to be inhaled into the lungs; or (c) is contained in a particulate composition to be blown into suitable body

- 188 -

tissues or cavities, where said composition optionally provides delayed-, sustained-, and/or controlled-release of said active ingredient; or (4) ingestion of said pharmaceutical composition in suitable solid or liquid form for peroral delivery of said active ingredient, where said active ingredient is contained in a solid dosage form; or (b) is contained in a liquid dosage form.

Particular dosage forms of the above-described pharmaceutical compositions include (1) suppositories as a special type of implant, comprising bases which are solid at room temperature but melt at body temperature, slowly releasing the active ingredient with which they are impregnated into the surrounding tissue of the body, where the active ingredient becomes absorbed and transported to effect systemic administration; (2) solid peroral dosage forms selected from the group consisting of (a) delayed-release oral tablets, capsules, caplets, lozenges, troches, and multiparticulates; (b) enteric-coated tablets and capsules which prevent release and absorption in the stomach to facilitate delivery distal to the stomach of the patient being treated; (c) sustained-release oral tablets, capsules and microparticulates which provide systemic delivery of the active ingredient in a controlled manner up to a 24-hour period; (d) fast-dissolving tablets; (e) encapsulated solutions; (f) an oral paste; (g) a granular form incorporated in or to be incorporated in the food of a patient being treated; and (h) liquid peroral dosage forms selected from the group consisting of solutions, suspensions, emulsions, inverse emulsions, elixirs, extracts, tinctures, and concentrates.

Pharmaceutical compositions within the scope of the present invention include those wherein the therapeutically effective amount of an active ingredient comprising a compound of the present invention required for treating or preventing diseases, disorders, and conditions mediated by or associated with modulation of PDE4, especially PDE4D activity as described herein is provided in a dosage form suitable for local administration to a patient being treated, wherein said pharmaceutical composition contains said active ingredient in suitable liquid form for delivering said active ingredient by: (1) injection or infusion into a local site which is intraarterial, intraarticular, intrachondrial, intracostal, intracystic, intra- or transdermal, intrafascicular, intraligamentous, intramedullary, intramuscular, intranasal, intraneural, intraocular, *i.e.*, ophthalmic administration, intraosteal, intrapelvic, intrapericardial, intraspinal, intrasternal, intrasynovial, intratarsal, or intrathecal; including components which provide delayed-release, controlled-release, and/or sustained-release of said active ingredient into said local site; where said active ingredient is contained: (a) in solution as a solute; (b) in the discontinuous phase of an emulsion, or the discontinuous phase of an inverse emulsion which inverts upon injection or infusion, said emulsions containing suitable emulsifying agents; or (c) in a suspension as a suspended solid in colloidal or microparticulate form, said suspension containing suitable suspending agents; or (2) injection or infusion as a depot for delivering

- 189 -

said active ingredient to said local site; wherein said composition provides storage of said active ingredient and thereafter delayed-, sustained-, and/or controlled-release of said active ingredient into said local site, and wherein said composition also includes components which ensure that said active ingredient has predominantly local activity, with little systemic carryover activity; or wherein said pharmaceutical composition contains said active ingredient in suitable solid form for delivering said inhibitor by: (3) instillation, inhalation or insufflation to said local site, where said active ingredient is contained: (a) in a solid implant composition which is installed in said local site, said composition optionally providing delayed-, sustained-, and/or controlled-release of said active ingredient to said local site; (b) in a particulate composition which is inhaled into a local site comprising the lungs; or (c) in a particulate composition which is blown into a local site, where said composition includes components which will ensure that said active ingredient has predominantly local activity, with insignificant systemic carryover activity, and optionally provides delayed-, sustained-, and/or controlled-release of said active ingredient to said local site. For ophthalmic use, the pharmaceutical compositions may be formulated as micronized suspension in isotonic, pH adjusted sterile saline, or, preferably, as solutions in isotonic, pH adjusted sterile saline, either with or without a preservative such as benzylalkonium chloride. Alternatively, for ophthalmic uses, the pharmaceutical compositions may be formulated in an ointment such as petrolatum.

The pharmaceutical compositions of the present invention may also be administered by nasal aerosol or inhalation through the use of a nebulizer, a dry powder inhaler or a metered dose inhaler. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, hydrofluorocarbons, and/or other conventional solubilizing or dispersing agents.

As already mentioned, the active ingredients of Formula (1.0.0) of the present invention may be administered systemically to a patient to be treated as a pharmaceutical composition in suitable liquid form by injection or infusion. There are a number of sites and organ systems in the body of the patient which will allow the properly formulated pharmaceutical composition, once injected or infused, to permeate the entire body and all of the organ system of the patient being treated. An injection is a single dose of the pharmaceutical composition forced, usually by a syringe, into the tissue involved. The most common types of injections are intramuscular, intravenous, and subcutaneous. By contrast, an infusion is the gradual introduction of the pharmaceutical composition into the tissue involved. The most common type of infusion is intravenous. Other types of injection or infusion comprise intraarterial, intra- or transdermal (including subcutaneous), or intraspinal especially intrathecal. In these liquid pharmaceutical compositions, the active ingredient may

- 190 -

be contained in solution as the solute. This is the most common and most preferred type of such composition, but requires an active ingredient in a salt form that has reasonably good aqueous solubility. Water (or saline) is by far the most preferred solvent for such compositions. Occasionally supersaturated solutions may be utilized, but these present stability problems that make them impractical for use on an everyday basis.

If it is not possible to obtain a form of some compound of Formula (1.0.0) that has the requisite degree of aqueous solubility, as may sometimes occur, it is within the skill of the artisan to prepare an emulsion, which is a dispersion of small globules of one liquid, the discontinuous or internal phase, throughout a second liquid, the continuous or external phase, with which it is immiscible. The two liquids are maintained in an emulsified state by the use of emulsifiers which are pharmaceutically acceptable. Thus, if the active ingredient is a water-insoluble oil, it can be administered in an emulsion of which it is the discontinuous phase. Also where the active ingredient is water-insoluble but can be dissolved in a solvent which is immiscible with water, an emulsion can be used. While the active ingredient would most commonly be used as the discontinuous or internal phase of what is referred to as an oil-in-water emulsion, it could also be used as the discontinuous or internal phase of an inverse emulsion, which is commonly referred to as a water-in-oil emulsion. Here the active ingredient is soluble in water and could be administered as a simple aqueous solution. However, inverse emulsions invert upon injection or infusion into an aqueous medium such as the blood, and offer the advantage of providing a more rapid and efficient dispersion of the active ingredient into that aqueous medium than can be obtained using an aqueous solution. Inverse emulsions are prepared by using suitable, pharmaceutically acceptable emulsifying agents well known in the art. Where the active ingredient has limited water solubility, it may also be administered as a suspended solid in colloidal or microparticulate form in a suspension prepared using suitable, pharmaceutically acceptable suspending agents. The suspended solids containing the active ingredient may also be formulated as delayed-, sustained-, and/or controlled-release compositions.

While systemic administration will most frequently be carried out by injection or infusion of a liquid, there are many situations in which it will be advantageous or even necessary to deliver the active ingredient as a solid. Systemic administration of solids is carried out by instillation, inhalation or insufflation of a pharmaceutical composition in suitable solid form containing the active ingredient. Instillation of the active ingredient may entail installing a solid implant composition into suitable body tissues or cavities. The implant may comprise a matrix of bio-compatible and bio-erodible materials in which particles of a solid active ingredient are dispersed, or in which, possibly, globules or isolated cells of a liquid active ingredient are entrapped. Desirably, the matrix will be broken down and completely absorbed by the body. The composition of the matrix is also preferably selected to provide

- 191 -

controlled-, sustained-, and/or delayed release of the active ingredient over extended periods of time, even as much as several months.

5 The term "implant" most often denotes a solid pharmaceutical composition containing the active ingredient, while the term "depot" usually implies a liquid pharmaceutical composition containing the active ingredient, which is deposited in any suitable body tissues or cavities to form a reservoir or pool which slowly migrates to surrounding tissues and organs and eventually becomes systemically distributed. However, these distinctions are not always rigidly adhered to in the art, and consequently, it is contemplated that there is included within the scope of the present invention liquid implants and solid depots, and even mixed solid and liquid forms for each. Suppositories may be regarded as a type of implant, since they
10 comprise bases which are solid at room temperature but melt at a patient's body temperature, slowly releasing the active ingredient with which they are impregnated into the surrounding tissue of the patient's body, where the active ingredient becomes absorbed and transported to effect systemic administration.

15 Systemic administration can also be accomplished by inhalation or insufflation of a powder, *i.e.*, particulate composition containing the active ingredient. For example, the active ingredient in powder form may be inhaled into the lungs using conventional devices for aerosolizing particulate formulations. The active ingredient as a particulate formulation may also be administered by insufflation, *i.e.*, blown or otherwise dispersed into suitable body
20 tissues or cavities by simple dusting or using conventional devices for aerosolizing particulate formulations. These particulate compositions may also be formulated to provide delayed-, sustained-, and/or controlled-release of the active ingredient in accordance with well understood principles and known materials.

25 Other means of systemic administration which may utilize the active ingredients of the present invention in either liquid or solid form include transdermal, intranasal, and ophthalmic routes. In particular, transdermal patches prepared in accordance with well known drug delivery technology may be prepared and applied to the skin of a patient to be treated, whereafter the active agent by reason of its formulated solubility characteristics migrates across the epidermis and into the dermal layers of the patient's skin where it is taken up as
30 part of the general circulation of the patient, ultimately providing systemic distribution of the active ingredient over a desired, extended period of time. Also included are implants which are placed beneath the epidermal layer of the skin, *i.e.* between the epidermis and the dermis of the skin of the patient being treated. Such an implant will be formulated in accordance with well known principles and materials commonly used in this delivery technology, and may be
35 prepared in such a way as to provide controlled-, sustained-, and/or delayed-release of the active ingredient into the systemic circulation of the patient. Such subepidermal (subcuticular)

- 192 -

implants provide the same facility of installation and delivery efficiency as transdermal patches, but without the limitation of being subject to degradation, damage or accidental removal as a consequence of being exposed on the top layer of the patient's skin.

5 In the above description of pharmaceutical compositions containing an active ingredient of Formula (1.0.0), the equivalent expressions: "administration", "administration of", "administering", and "administering a" have been used with respect to said pharmaceutical compositions. As thus employed, these expressions are intended to mean providing to a patient in need of treatment a pharmaceutical composition of the present invention by any of the routes of administration herein described, wherein the active ingredient is a compound of
10 Formula (1.0.0) or a prodrug, derivative, or metabolite thereof which is useful in treating a disease, disorder, or condition mediated by or associated with modulation of PDE4, especially PDE4D activity in said patient. Accordingly, there is included within the scope of the present invention any other compound which, upon administration to a patient, is capable of directly or indirectly providing a compound of Formula (1.0.0). Such compounds are recognized as
15 prodrugs, and a number of established procedures are available for preparing such prodrug forms of the compounds of Formula (1.0.0).

The dosage and dose rate of the compounds of Formula (1.0.0) effective for treating or preventing a disease, disorder, or condition mediated by or associated with modulation of PDE4, especially PDE4D activity, will depend on a variety of factors, such as the nature of the
20 inhibitor, the size of the patient, the goal of the treatment, the nature of the pathology to be treated, the specific pharmaceutical composition used, and the observations and conclusions of the treating physician.

For example, where the dosage form is oral, e.g., a tablet or capsule, suitable dosage levels of the compounds of Formula (1.0.0) will be between about 0.1 µg/kg and about 50.0
25 mg/kg body weight per day, preferably between about 5.0 µg/kg and about 5.0 mg/kg body weight per day, more preferably between about 10.0 µg/kg and about 1.0 mg/kg of body weight per day, and most preferably between about 20.0 µg/kg and about 0.5 mg/kg of body weight per day of the active ingredient.

Where the dosage form is topically administered to the bronchia and lungs, e.g., by
30 means of a powder inhaler or nebulizer, suitable dosage levels of the compounds of Formula (1.0.0) will be between about 0.001 µg/kg and about 10.0 mg/kg body weight per day, preferably between about 0.5 µg/kg and about 0.5 mg/kg body weight per day, more preferably between about 1.0 µg/kg and about 0.1 mg/kg of body weight per day, and most preferably between about 2.0 µg/kg and about 0.05 mg/kg of body weight per day of the
35 active ingredient.

- 193 -

Using representative body weights of 10 kg and 100 kg in order to illustrate the range of daily aerosolized topical dosages which might be used as described above, suitable dosage levels of the compounds of Formula (1.0.0) will be between about 1.0 - 10.0 μ g and 500.0 - 5000.0 mg per day, preferably between about 5.0 - 50.0 μ g and 5.0 - 50.0 mg per day, more preferably between about 100.0 - 1000.0 μ g and 10.0 - 100.0 mg per day, and most preferably between about 200.0 - 2000.0 μ g and about 5.0 - 50.0 mg per day of the active ingredient comprising a compound of Formula (1.0.0). These ranges of dosage amounts represent total dosage amounts of the active ingredient per day for a given patient. The number of times per day that a dose is administered will depend upon such pharmacological and pharmacokinetic factors as the half-life of the active ingredient, which reflects its rate of catabolism and clearance, as well as the minimal and optimal blood plasma or other body fluid levels of said active ingredient attained in the patient which are required for therapeutic efficacy

Numerous other factors must also be considered in deciding upon the number of doses per day and the amount of active ingredient per dose that will be administered. Not the least important of such other factors is the individual response of the patient being treated. Thus, for example, where the active ingredient is used to treat or prevent asthma, and is administered topically *v/a* aerosol inhalation into the lungs, from one to four doses consisting of actuations of a dispensing device, *i.e.*, "puffs" of an inhaler, will be administered each day, each dose containing from about 50.0 μ g to about 10.0 mg of active ingredient.

The compounds of Formula (1.0.0) may be administered in a controlled release formulation such as a slow release or a fast (immediate) release formulation. Such controlled release formulations of the compounds of Formula (1.0.0) may be prepared using methods well known to those skilled in the art. For example, the formulation of a therapeutic product having up to three or even four dosage forms with different release profiles may be prepared. With respect to the immediate release component, in one embodiment, the immediate release dosage form component provides from about 20% to about 50% of the total dosage of therapeutic agent to be delivered by the product. With respect to the delayed release component, the time of release can be controlled by the concentration of the therapeutic agent in the coating and/or the thickness of the coating. These remaining dosage forms deliver the remainder of the therapeutic agent. If more than one delayed release dosage form is used, each of the delayed release dosage forms may provide about equal amounts of therapeutic agent, but they may also be formulated to provide different amounts. Each of the dosage forms may contain the same therapeutic agent, but each of the dosage forms may also contain more than one, or different therapeutic agent.

- 194 -

The immediate release portion of the controlled release formulation can be a mixture of ingredients that breaks down quickly after administration to release the therapeutic agent. This can take the form of either a discrete pellet or granule that is mixed in with, or compressed with, the other components of the formulation. The materials for the immediate release component include, e.g., microcrystalline cellulose, corn starch, pregelatinized starch, potato starch, rice starch, sodium carboxymethyl starch, hydroxypropyl cellulose, hydroxypropylmethylcellulose, hydroxyethylcellulose, ethylcellulose, chitosan, hydroxychitosan, hydroxymethylated-chitosan, cross-linked chitosan, cross-linked hydroxymethylchitosan, maltodextrin, mannitol, sorbitol, dextrose, maltose, fructose, glucose, levulose, sucrose, polyvinylpyrrolidone (PVP), acrylic acid derivatives, e.g., Carbopol and Eudragit, polyethylene glycols, e.g., low molecular weight PEGs PEG2000-10000, and high molecular weight PEGs, e.g., Polyox, with molecular weights above 20,000 daltons. These materials will usually be present in the range of 1.0 to 60% (W/W).

It may be desirable to have other ingredients in the controlled release formulation as an aid in the dissolution of the therapeutic agent, or in the breakdown of some other component after ingestion or administration. Such ingredients include surfactants, e.g., sodium lauryl sulfate, sodium monoglycerate, sorbitan monooleate, sorbitan monooleate, polyoxyethylene sorbitan monooleate, glyceryl monostearate, glyceryl monooleate, glyceryl monobutyrate, a non-ionic surfactant, e.g., from Pluronic, or other materials with surface active properties. All of these ingredients may be used in combination and will usually be present in the range of 0.05-15% (W/W).

A non-pH-sensitive delayed release component of the controlled release formulations used in the present invention may have the same ingredients as the immediate release component described above, but with additional polymers integrated into the composition, or applied as coatings over the pellet or granule which is formed. Materials used to obtain a delay in release suitable for this component are, e.g., polyethylene glycol (PEG) with a molecular weight above 4,000 daltons, e.g., Carbowax and Polyox, waxes, e.g., white wax or bees wax, paraffin, acrylic acid derivatives, e.g., Eudragit, propylene glycol, and ethylcellulose. Typically, these materials are present in the range of 0.5-25% (W/W) of this component.

A pH-sensitive, i.e., enteric release component of the controlled release formulations used in the present invention may have the same ingredients as the immediate release component described above, but with additional polymers integrated into the composition, or applied as coatings over the pellet or granule which is formed. The kind of materials useful for this purpose are cellulose acetate phthalate, Eudragit L, and other phthalate salts of cellulose derivatives, which can be present in concentrations from 4-20% (W/W).

- 195 -

A sustained release component of the controlled release formulations used in the present invention may have the same ingredients as the immediate release component described above, but with additional polymers integrated into the composition, or applied as coatings over the pellet or granule which is formed. The kind of materials useful for this purpose are ethylcellulose, hydroxypropylmethylcellulose, hydroxypropylcellulose, hydroxyethyl cellulose, carboxymethyl cellulose, methylcellulose, nitrocellulose, Eudragit R, and Eudragit RL, Carbopol, and polyethylene glycols with molecular weights in excess of 8,000 daltons, which may be present in concentrations from 4-20% (W/W).

The particulate units that form the basis for the controlled release formulations used in the present invention may be in the form of discrete pellets or particles contained in a capsule, or in the form of particles embedded in a tablet or suspended in a liquid suspension. The controlled release formulation may be administered, e.g., by a sublingual, transmucosal, transdermal, or parenteral route, and preferably is administered orally.

In a particular embodiment of the controlled release formulation used in the present invention, the formulation of a compound of Formula (1.0.0) is preferably based on active pellets having a core forming inert component which may comprise non-pareil sugar seeds (sugar spheres, USP XXII) having an average size of from 14 to 35 mesh. The core forming inert component is coated with a formulation which comprises a compound of Formula (1.0.0) and hydroxypropyl methylcellulose. A sufficient amount of the coating is applied to provide the desired dosage of a compound of Formula (1.0.0), i.e., preferably between about 5.0 µg/kg and about 5.0 mg/kg body weight per day.

To form a pellet designated A, the active pellet is then coated with a seal coat which may comprise a mixture of hydroxypropyl methylcellulose and polyethylene glycol. The polyethylene glycol may have a number average molecular weight of from 200 to 2000. Generally a ratio of 2:1 to 6:1 of hydroxypropyl methylcellulose to polyethylene glycol may be applied as a 3 to 7 wt % solution in a solvent such as ethanol, isopropyl alcohol, water, and mixtures thereof. The seal coat is then coated with a release modifying coating which comprises a mixture of an acrylic resin which is soluble in acidic media, and a water insoluble polymer, e.g., a cellulosic polymer such as ethylcellulose or cellulose acetate, in a weight ratio of about 1:4, respectively. Said release modifying coating is applied from a 3 to 7 wt % solution of isopropyl alcohol, ethanol, acetone, or mixtures thereof. A useful acrylic resin which is soluble in acidic media is Eudragit E which is a cationic copolymer of dimethylaminoethyl methacrylate and neutral methacrylic acid esters having a mean weight average molecular weight of 150,000.

To form a pellet designated B, pellet A is coated with a first coating of hydroxypropyl methylcellulose, after which an enteric coating is applied, where the enteric coating polymer is

- 196 -

shellac, methacrylic acid copolymers (Eudragit S or L), cellulose acetate phthalate, hydroxypropylmethylcellulose phthalate, hydroxypropylmethylcellulose acetate succinate, cellulose acetate trimellitate, polyvinyl acetate phthalate, or mixtures thereof, preferably cellulose acetate phthalate. The thickness of the coating is selected to provide the desired release rate, which depends on the thickness and the constituents of the coating.

Auxiliary coating aids may be utilized, e.g., 1-5 wt % based on the active core component and the total weight of the final coating, of a plasticizer such as acetyltributyl citrate, triacetin, acetylated monoglyceride, rape oil, olive oil, sesame oil, acetyltriethylcitrate, glycerin sorbitol, diethyloxalate, diethylmalate, diethylfumarate, dibutylsuccinate, diethylmalonate, dioctylphthalate, dibutylsebacate, triethylcitrate, tributylcitrate, glyceroltributyrate, polyethyleneglycol (molecular weight of from 380 to 420), propylene glycol and mixtures thereof, in combination with one or more antisticking agents, e.g., an alkaline earth metal stearate such as magnesium stearate or calcium stearate, or talc.

The cores are formed by spraying the non-pareil seeds with an aqueous or non-aqueous suspension which contains a compound of Formula (1.0.0) and hydroxypropyl methylcellulose. The suspension medium may comprise any low viscosity solvent, e.g., isopropyl alcohol, ethanol, water, or mixtures thereof. It is preferred to dry each coating before applying a second coating. Pellets A and pellets B are blended together to obtain a finished product having the following *in vitro* release profile: 50 to 80 wt % released after 2 hours in SGF (pH 1.5); 70 to 95 wt % released after 4 hours in SGF (pH 1.5); and not less than 80 wt % released after 6 hours in SGF (pH 1.5); as determined in a USPXXII Type 2 apparatus, at 37° C. and 50 rpm.

The pellets may be placed in a gelatin capsule or they may be made into tablets by first adding from 25 to 40 wt % of a solid, pharmaceutically acceptable tablet excipient, e.g., lactose, dextrose, mannitol, calcium phosphate, microcrystalline cellulose, kaolin, powdered sucrose or mixtures thereof, which will form a compressible mixture with pellets A and B, preferably without crushing pellets A or B, and optionally an effective amount of a tablet disintegrating agent, e.g., crospovidone, croscarmellose sodium, dry starch, or sodium starch glycolate, and a lubricant.

In another embodiment of a controlled release formulation used in the present invention, crosslinked polyvinyl alcohol (PVA) microspheres containing a compound of Formula (1.0.0) are prepared from an aqueous solution of PVA containing various concentrations of glutaraldehyde dispersed as droplets in liquid paraffin using a suitable sizing agent. Crosslinking of the PVA droplets with glutaraldehyde is induced by an acid catalyst, HCl, which is produced by the addition of small quantities of benzoyl chloride into the dispersion medium. Microspheres containing a compound of Formula (1.0.0) are prepared by

- 197 -

carrying out the crosslinking reaction in the presence of said compound of Formula (1.0.0). In another embodiment, polycarbonate microspheres loaded with a compound of Formula (1.0.0) are prepared by a solvent evaporation technique which results in high drug loading of >50%

5 A further embodiment of the controlled release formulations for use in the present invention comprises controlled-release tablets having an internal drug containing phase and an external phase comprising a polyethylene glycol (PEG) polymer which has a weight average molecular weight of 3000-10000. A compound of Formula (1.0.0) in crystalline form is loaded into a coating pan and spray-coated with a suspension containing Eudragit L30D,
10 acetyl triethylcitrate, talc, and water at 54- 60° C. until the coated crystals of said compound of Formula (1.0.0) are formed. The coated crystals are mixed with an equal weight of PEG (av. mol. wt. 3350) at 50° C. to form a molten blend which is formed into tablets.

 Another sustained release oral solid dosage form embodiment for use in the present invention comprises an effective amount of a compound of Formula (1.0.0) having a solubility
15 of less than about 10 g/l; and a sustained release excipient comprising a gelling agent, an inert pharmaceutical diluent, and an effective amount of a pharmaceutically acceptable cationic crosslinking agent. The ratio of the compound of Formula (1.0.0) to gelling agent is preferably from about 1:3 to about 1:8, and the resulting tablet provides a therapeutically effective blood level of the compound of Formula (1.0.0) for at least about 12 hours, and in
20 preferred embodiments, for about 24 hours. Preferably, said gelling agent is a heteropolysaccharide gum and a homopolysaccharide gum capable of cross-linking said heteropolysaccharide gum when exposed to an environmental fluid, and said inert pharmaceutical diluent is granulated with a solution or a dispersion of a hydrophobic material in an amount effective to slow the hydration of the gelling agent without disrupting the
25 hydrophilic matrix. The combination of xanthan gum with locust bean gum is a preferred gelling agent.

 The cationic cross-linking agent may be monovalent or multivalent metal cations. The preferred salts are the inorganic salts, including various alkali metal and/or alkaline earth metal sulfates, chlorides, borates, bromides, citrates, acetates, lactates, etc. Preferred salts
30 are calcium sulfate and sodium chloride. The cationic cross-linking agent is added in an amount effective to obtain a desired increase in gel strength, typically in an amount from about 1 to about 20% by weight of the sustained release excipient.

 The hydrophobic polymer is selected from an alkylcellulose such as ethylcellulose, other hydrophobic cellulosic materials, polymers or copolymers derived from acrylic or
35 methacrylic acid esters, copolymers of acrylic and methacrylic acid esters, zein, waxes, shellac, and hydrogenated vegetable oils. Commercially available alkylcelluloses are

Aquacoat, an aqueous dispersion of ethylcellulose available from FMC, and Surelease, an aqueous dispersion of ethylcellulose available from Colorcon); and acrylic polymers include Eudragit® RS and RL, which are copolymers of acrylic and methacrylic acid esters having a low content, e.g. 1:20 or 1:40, of quaternary ammonium compounds.

5 It is important to include an effective amount of a wetting agent in the controlled release formulation described above in order to increase the bioavailability of compounds of Formula (1.0.0) with poor solubility. The wetting agent may be added, e.g., by spraying while mixing the granulate. Suitable wetting agents include polyethyleneglycols as esters or ethers, e.g., polyethoxylated castor oil, polyethoxylated hydrogenated castor oil, polyethoxylated fatty acid from castor oil, or polyethoxylated fatty acid from hydrogenated castor oil. Commercially available wetting agents are Cremophor, Myrj, Polyoxyl 40 stearate, Emerest 2675, Lipal 395 and PEG 3350.

15 Thereafter, a formulator need only blend the desired compound of Formula (1.0.0) and an optional lubricant with the excipient and then compress the mixture to form slow release tablets. The excipient may comprise a physical admix of the gums along with a soluble excipient such as compressible sucrose, lactose or dextrose, although it is preferred to granulate or agglomerate the gums with plain, i.e., crystalline, sucrose, lactose, dextrose, etc., to form an excipient. The granulate form has certain advantages including the fact that it can be optimized for flow and compressibility; it can be tableted, formulated in a capsule, 20 extruded and spheronized with an active medicament to form pellets, etc.

The pharmaceutical excipients prepared in accordance with the present invention may be prepared according to any agglomeration technique to yield an acceptable excipient product. In wet granulation techniques, the desired amounts of the heteropolysaccharide gum, the homopolysaccharide gum, and the inert diluent are mixed together and thereafter a 25 moistening agent such as water, propylene glycol, glycerol, alcohol or the like is added to prepare a moistened mass. Next, the moistened mass is dried. The dried mass is then milled with conventional equipment into granules.

In still further embodiments of the controlled release formulations used in the present invention, a compound of Formula (1.0.0) having poor aqueous solubility forms a solid 30 dispersion in a hydrophilic poloxamer polymer, said solid dispersion being blended with a water swellable hydroxypropylmethylcellulose, a 2% solution of which has a viscosity in the range 100-100,000 centipoise, to form a hydrogel matrix, and one or more tableting ingredients to form a tablet core, said tablet core as such or following coating of the core with a polymeric coating being effective to achieve therapeutic levels of said compound of Formula 35 (1.0.0) over extended periods of time following oral administration.

- 199 -

A surfactant component may be included, which is an anionic, cationic or non-ionic surfactant selected from sodium lauryl sulphate, a sodium carboxylate, an alkyl sulphate, a polyethylene glycol ester, a polyethylene ether, a sorbitan ester, an ethoxylated sorbitan ester, an alkyl trimethylammonium halide, and a mixture thereof. The solid dispersion may also include an acid component selected from adipic acid, ascorbic acid, citric acid, fumaric acid, malic acid, succinic acid and tartaric acid. Further, the solid dispersion may include a base component selected from calcium carbonate, calcium hydroxide, magnesium hydroxide, sodium bicarbonate, sodium carbonate, sodium citrate, and sodium hydroxide.

The poloxamer polyols are a series of closely related block copolymers of ethylene oxide and propylene oxide, and more especially, the poloxamer polyols are α -hydro- ω -hydroxypoly(oxyethylene)poly(oxypropylene)poly(oxyethylene) block copolymers, more generally known as polyethylene-propylene glycol copolymer or polyoxyethylene-polyoxypropylene copolymer. Preferred poloxamers are those which contain between 60% and 90%, more especially between 70% and 80%, by weight of the polyoxyethylene portion. The polyoxyethylene segment is hydrophilic while the polyoxypropylene segment is hydrophobic. The poloxamers differ only in the relative amounts of propylene oxide and ethylene oxide added during manufacture. Poloxamer polyols (poloxamers) are known by the trade names Lutrol, Monolan and Pluronic. Poorly soluble compounds of Formula (1.0.0) are readily dispersible in the melt form of the poloxamers, and when cooled the mixture of compound of Formula (1.0.0), auxiliary agent(s), if present, and poloxamer forms a dry, hard solid which can be easily ground or milled.

The solid oral dosage form of the above-mentioned embodiment may be in the form of a capsule or of a tablet. The tablet consists of a tablet core defined by a solid dispersion as already described, dispersed in a hydrogel matrix. The solid dispersion is compressed into a dosage form containing a polymer or mixture of polymers which when wet will swell to form a hydrogel. The rate of release of a compound of Formula (1.0.0) from this dosage form is controlled both by diffusion from the swollen tablet mass and by erosion of the tablet surface over time. The rate of release of a compound of Formula (1.0.0) may be controlled both by the amount of polymer per tablet and by the inherent viscosities of the polymers used. A preferred water swellable polymer is hydroxypropylmethylcellulose (HPMC).

The solid dispersion is in the form of an instant release tablet core which is adapted for direct compression followed by coating with the rate-controlling membrane. A primary consideration with such a formulation is the selection of suitable tablet ingredients to impart the desired effect while compressing easily; accordingly, the solid dispersion is suitably blended with standard tablet excipients such as a standard compressing base, a

- 200 -

compressible sugar, a solubilising agent and a lubricating agent. In this type of dosage form, release of a compound of Formula (1.0.0) is controlled via a diffusion mechanism.

In order to obtain the desired release profile suitable for once-daily administration, the rate-controlling membrane will suitably contain a major proportion of a pharmaceutically acceptable film-forming, water insoluble polymer and optionally a minor proportion of a pharmaceutically acceptable film-forming, water soluble polymer. Water soluble polymers include polymers which are freely permeable to water, while water insoluble polymers include polymers which are slightly permeable to water. Preferably the water soluble polymer in the membrane, if present, is selected from polyvinyl alcohol, polyvinylpyrrolidone, methyl cellulose, hydroxypropyl cellulose, hydroxypropylmethyl cellulose, agar, carrageenan, xanthan, polyethylene glycol, and mixtures thereof. The incorporation of various hydrophilic agents into the polymer coating so as to form channels in said coating can be used and in general leads to a more linear release rate. Such hydrophilic agents include fumaric acid, citric acid, tartaric acid, sodium citrate, sodium bicarbonate, sodium fumarate, sodium carbonate, monosaccharides and disaccharides. An especially suitable monosaccharide is glucose. Alternatively, the water soluble polymer in the membrane can be replaced by a polymeric material which is freely permeable to the active ingredient and water and comprises a copolymer of acrylic and methacrylic acid esters. A suitable polymer which is freely permeable to various poorly soluble compounds of Formula (1.0.0) and water is that sold as Eudragit RL..

Other pharmaceutically acceptable film-forming, water soluble polymers which may be used include cellulose acylate, cellulose diacylate, cellulose triacylate, cellulose acetate, cellulose diacetate, cellulose triacetate, beta-glycan acetate, acetaldehyde dimethyl acetate, cellulose acetate ethyl carbamate, polyamide, polyurethane, sulfonated polystyrene, cellulose acetate phthalate, cellulose acetate methyl carbamate, cellulose acetate succinate, cellulose acetate dimethylaminoacetate, cellulose acetate chloracetate, cellulose dipalmitate, cellulose dioctanoate, cellulose dicaprylate, cellulose dipentylate, cellulose acetate valerate, cellulose acetate *p*-toluenesulfonate, cellulose acetate butyrate, and other semi-permeable polymers such as those described in U.S. Pat. No. 4, 285,987, and selectively permeable polymers formed by the coprecipitation of a polycation and a polyanion as disclosed in U.S. Pat. Nos. 3,173,876, 3,276,586; 3,541,005; 3,541,006 and 3,546,142.

The water insoluble polymer is preferably selected from ethylcellulose, cellulose acetate, cellulose propionate (lower, medium or higher molecular weight), cellulose acetate propionate, cellulose acetate butyrate, cellulose acetate phthalate, cellulose triacetate, poly(methyl methacrylate), poly(ethyl methacrylate), poly(butyl methacrylate), poly(isobutyl methacrylate), poly(hexyl methacrylate), poly(isodecyl methacrylate), poly(lauryl

- 201 -

methacrylate), poly(phenyl methacrylate), poly(methyl acrylate), poly(isopropyl acrylate), poly(isobutyl acrylate), poly(octadecyl acrylate), poly(ethylene), poly(ethylene) low density, poly(ethylene) high density, poly(propylene), poly(ethylene oxide), poly(ethylene terephthalate), poly(vinyl isobutyl ether), poly(vinyl acetate), poly(vinyl chloride), polyurethane, and mixtures thereof. The water insoluble polymer of the membrane may also comprise naturally occurring polymers or resins, e.g., shellac, chitosan, gum juniper, wax or a wax-like substance, zeln, hydrogenated vegetable oils, or a mixture thereof.

The water insoluble polymer in the membrane may also be replaced by a polymeric material which is slightly permeable to the active ingredient and water and comprises a copolymer of acrylic and methacrylic acid esters, e.g., a polymer sold as Eudragit RS, or a polymer whose permeability is pH dependent and sold as Eudragit L, Eudragit S, or Eudragit E. Eudragit S is preferred. Eudragit polymers are polymeric lacquer substances based on acrylates and/or methacrylates. Eudragit RL and Eudragit RS are acrylic resins comprising copolymers of acrylic and methacrylic acid esters with a low content of quaternary ammonium groups which are present as salts and give rise to the permeability of the lacquer films. Eudragit is freely permeable and Eudragit RS is slightly permeable, both independent of pH. Eudragit S is an anionic polymer synthesized from methacrylic acid and methacrylic acid methyl ester, which is insoluble in acids and pure water, but becomes soluble in a neutral to weakly alkaline milieu by forming salts with alkalis. The permeability of Eudragit S is pH dependent, since above pH 6.0 the polymer becomes increasingly permeable.

The coating solution/suspension of the polymeric material comprises one or more polymer(s) dissolved/suspended in a suitable solvent or mixture of solvents. The concentration of the polymeric material in the coating solution/suspension is determined by the viscosity of the final solution/suspension. The addition of a plasticizing agent to the polymeric solution/ suspension may be necessary, depending on the formulation, to improve the elasticity and stability of the polymer film and to prevent changes in the polymer permeability over prolonged storage. Such changes may affect the rate of release of a compound of Formula (1.0.0). Suitable plasticizing agents include polyethylene glycol, propylene glycol, glycerol, triacetin, dimethyl phthalate, diethyl phthalate, dibutyl phthalate, dibutyl sebacate, triethyl citrate, tributyl citrate, triethyl acetyl citrate, castor oil and varying percentages of acetylated monoglycerides.

Because ethylcellulose, a preferred hydrophobic polymer material, has a relatively high glass transition temperature and does not form flexible films under normal coating conditions, it is necessary to plasticize the ethylcellulose before using the same as a coating material. The plasticization of the ethylcellulose may be accomplished either by so-called "internal plasticization" and "external plasticization." The suitability of a plasticizer depends

- 202 -

on its affinity or solvating power for the polymer and its effectiveness at interfering with polymer-polymer attachments. Such activity imparts the desired flexibility by relieving molecular rigidity. Generally, the amount of plasticizer included in a coating solution is based on the concentration of the film-former, e.g., most often from about 1 to about 50 percent by weight of the film-former. Concentration of the plasticizer, however, can only be properly determined after careful experimentation with the particular coating solution and method of application. Most preferably, about 20% plasticizer is included in the aqueous dispersion of acrylic polymer.

An important parameter in the determination of a suitable plasticizer for a polymer is related to the glass transition temperature (T_g) of the polymer. The glass transition temperature is related to the temperature or temperature range where there is a fundamental change in the physical properties of the polymer. This change does not reflect a change in state, but rather a change in the macromolecular mobility of the polymer. Below the T_g , the polymer chain mobility is severely restricted. Thus, for a given polymer, if its T_g is above room temperature, the polymer will behave as a glass, being hard, non-pliable and rather brittle, properties which are too restrictive in film coating since the coated dosage form may be subjected to a certain amount of external stress. Incorporation of suitable plasticizers into the polymer matrix effectively reduces the T_g , so that under ambient conditions the films are softer, more pliable and often stronger, and thus better able to resist mechanical stress.

Other aspects of suitable plasticizers include the ability of the plasticizer to act as a good "swelling agent" for the ethylcellulose, and the solubility profile of the polymer film in water. Examples of suitable plasticizers for ethylcellulose include dibutyl sebacate, diethyl phthalate, triethyl citrate and tributyl citrate, although other plasticizers, e.g., acetylated monoglycerides, phthalate esters, and castor oil, may be used. Examples of suitable plasticizers for the above-described acrylic polymers include citric acid esters such as triethyl citrate NF XVI, tributyl citrate, dibutyl phthalate, and 1,2-propylene glycol. Other plasticizers which have proved to be suitable for enhancing the elasticity of the films formed from acrylic polymers such as Eudragit RL and RS lacquer solutions, include polyethylene glycols, propylene glycol, diethyl phthalate, castor oil, and triacetin.

A suitable aqueous dispersion of ethylcellulose is Aquacoat sold by FMC Corp., which is prepared by dissolving the ethylcellulose in a water-immiscible organic solvent and then emulsifying the same in water in the presence of a surfactant and a stabilizer. After homogenization to generate submicron droplets, the organic solvent is evaporated under vacuum to form a pseudolatex. The plasticizer is not incorporated in the pseudolatex during the manufacturing phase; consequently, prior to using the same as a coating, it is necessary to intimately mix the Aquacoat with a suitable plasticizer. Another suitable aqueous

- 203 -

dispersion of ethylcellulose is Surelease sold by Colorcon, Inc., which is prepared by incorporating plasticizer into the dispersion during the manufacturing process. A hot melt of a polymer, plasticizer (dibutyl sebacate), and stabilizer (oleic acid) is prepared as a homogeneous mixture, which is then diluted with an alkaline solution to obtain an aqueous dispersion which can be applied directly onto substrates.

It has further been found that the addition of a small amount of talc reduces the tendency of the aqueous dispersion to stick during processing, and acts as a polishing agent.

Coating the active tablet core with a differentially permeable membrane allows active dissolution and diffusion from the micro-environment of the active core. Especially suitable polymers for this purpose are cellulose and poly(methacrylate) based polymers, and the coating is suitably performed in a C.F. 360 granulator. Preferred solvents for use in polymer application/coating include acetone, isopropyl alcohol and industrial methylated spirit. A plasticized aqueous dispersion of hydrophobic polymer may be applied onto a tablet core by spraying, using any suitable spray equipment known in the art. In a preferred method, a Wurster fluidized-bed system is used in which an air jet, injected from underneath, fluidizes the core material and effects drying while the acrylic polymer coating is sprayed on. A sufficient amount of the aqueous dispersion of hydrophobic polymer to obtain a predetermined controlled release of a compound of Formula (1.0.0) when the coated substrate is exposed to aqueous solutions, e.g., gastric fluid, is preferably applied, taking into account the physical characteristics of said compound of Formula (1.0.0), the manner of incorporation of the plasticizer, etc. After coating with the hydrophobic polymer, a further overcoat of a film-former, such as hydroxypropylmethylcellulose, e.g., Opadry, is optionally applied to the tablets. This overcoat is provided, if at all, in order to substantially reduce agglomeration of the tablets.

The problem of stability of controlled release pharmaceutical formulations using aqueous dispersions of hydrophobic polymers, i.e., that the dissolution release profile changes on ageing, may be overcome by curing the coated tablet at a temperature greater than the glass transition temperature of the aqueous dispersion of plasticized hydrophobic polymer and at a necessary relative humidity until an endpoint is reached at which said substrate attains a dissolution profile which is substantially unaffected by exposure to accelerated storage conditions, e.g., of about 37°-40° C. and about 75- 80% relative humidity for three months or longer.

Controlled release coatings for compounds of Formula (1.0.0) may also include release-modifying agents such as cellulose acetate phthalate disclosed in U.S. Pat. No. 2,196,768, shellac, zein, hydroxypropylmethyl cellulose phthalate, sandarac, modified shellac, etc. Suitable release-modifying agents may also encompass erosion-promoting agents such

- 204 -

as starch, including corn starch, rice starch, carboxymethyl starch, potato starch, and other vegetable starches, modified starch, and starch derivatives. This category includes other erosion-promoting agents such as gums, e.g., xanthan gum, alginic acid, other alginates, bentonite, veegum, agar, guar, locust bean gum, gum arabic, quince psyllium, flax seed, okra gum, arabinoglactin, pectin, tragacanth, scleroglucan, dextran, amylose, amylopectin, dextrin, etc., cross-linked polyvinylpyrrolidone, ion-exchange resins, such as potassium polymethacrylate, carrageenan, κ -carrageenan, λ -carrageenan, gum karaya, biosynthetic gum, etc.

Controlled release coatings for compounds of Formula (1.0.0) may also include materials useful for making microporous lamina in the environment of use. Materials useful for making the microporous lamina include polycarbonates comprised of linear polyesters of carbonic acid in which carbonate groups reoccur in the polymer chain, microporous materials prepared by the phosgenation of a dihydroxyl aromatic such as bisphenol, a microporous poly(vinylchloride), microporous polyamides such as polyhexamethylene adipamide, microporous modacrylic copolymers including those formed from poly(vinylchloride) and acrylonitrile, microporous styreneacrylate and its copolymers, porous polysulfones characterized by diphenylene sulfone in a linear chain thereof, halogenated poly(vinylidene), polychloroethers, acetal polymers, polyesters prepared by esterification of a dicarboxylic acid or anhydride with an alkylene polyol, poly(alkylenesulfides), phenolics, polyesters, microporous polysaccharides having substituted anhydroglucose units exhibiting a decreased permeability to the passage of water and biological fluids, asymmetric porous polymers, cross-linked olefin polymers, hydrophobic or hydrophilic microporous homopolymers, copolymers or interpolymers having a reduced bulk density, and materials described in U.S. Pat. Nos. 3,595,752; 3,643,178; 3,654,066; 3,709,774; 3,718,532; 3,803,601; 3,852,224; 3,852,388; and 3,853,601; in British Pat. No. 1,126,849; and in Chem. Abst. Vol. 71, 427F, 22573F, 1969.

Additional microporous materials for forming microporous lamina include poly(urethane), cross-linked chain-extended poly(urethane), poly(imides), poly(benzimidazole), collodion, regenerated proteins, semi-solid cross-linked poly(vinylpyrrolidone), microporous materials prepared by diffusion of multivalent cations into polyelectrolyte sols, microporous derivatives of poly(styrene) such as poly(sodium-styrenesulfonate), poly(vinyl benzyl trimethyl-ammonium chloride), microporous cellulosic acrylates and the like microporous polymers such as those described in U.S. Pat. Nos. 3,524,753; 3,565,259; 3,276,589; 3,541,055; 3,541,006; 3,546,142; 3,615,024; 3,646,178, and 3,852,224. Pore-formers useful for forming the microporous lamina in the environment of use include solids and pore-forming liquids.

- 205 -

The term pore-former also embraces micropath formers, and removal of the pore and/or pore-former leads to both embodiments. The expression pore-forming liquids generically embraces semi-solids and viscous fluids. The pore-formers can be inorganic or organic. The term pore-former for both solids and liquids includes substances that can be

5 dissolved, extracted or leached from the precursor microporous wall by fluid present in the environment of use to form open-celled type microporous lamina. The pore-forming solids have a size, e.g., of about 0.1 to 200 μ and they include alkali metal salts such as lithium carbonate, sodium chloride, sodium bromide, potassium chloride, potassium sulfate, potassium phosphate, sodium acetate, sodium citrate, suitable calcium salts, and the like.

10 Organic compounds include polysaccharides such as sucrose, glucose, fructose, mannitol, mannose, galactose, sorbitol and the like. The pore-forming solids can be polymers soluble in the environment of use such as Carbowaxes, Carbopol, and the like. The pore-formers embrace diols, polyols, polyhydric alcohols, polyalkylene glycols, polyglycols, poly(a-w)alkylenediols, and the like. The pore-formers are non-toxic and on their removal from

15 lamina, channels and pores are formed through the lamina that fill with fluid present in the environment use.

The controlled release coatings used to deliver compounds of Formula (1.0.0) may also include an exit means comprising at least one passageway, orifice, or the like. The passageway may be formed by such methods as those disclosed in U.S. Pat. Nos. 3,845,770;

20 3,916,889; 4,063,064; and 4,088, 864. The passageway can have any shape such as round, triangular, square, elliptical, irregular, etc.

Other classes of controlled release delivery systems may be used to administer the compounds of Formula (1.0.0). For example, osmotic devices have demonstrated utility in delivering therapeutic agents to an environment of use in a controlled manner over prolonged

25 periods of time. Known devices of this type include tablets, pills, and capsules. The art has endeavored to develop new membranes that deliver active agents by diffusion and/or osmotic pumping. For example, U.S. Patent No. 4,235,236 discloses an osmotic device that delivers a therapeutic agent by the combined mechanisms of diffusion and osmotic pumping. The device comprises a microporous wall surrounding a compartment containing an active agent

30 and an expandable member. The expandable member consists of a semipermeable, flexible or expandable film surrounding a member selected from the group consisting of an osmotically effective solute, a gas generating couple and a swellable polymer. The external wall of the device is formed of a microporous material through which the active agent is delivered, which allows the release of the active agent at a steady rate, the so called zero-

35 order release. Suitable devices of this and related types may be used to deliver a compound of Formula (1.0.0).

- 206 -

U.S. Patent No. 4,327,725 discloses an osmotic device comprising a semipermeable wall surrounding two layers, one layer containing an active agent and the other an expandable hydrogel. A passageway in the wall communicates the active agent layer with the environment of use. Cellulose acylate is used to make the semipermeable membrane.

5 U.S. Patents No. 5,612,059 and No. 5,698,220 disclose the use of asymmetric membranes in delivery devices. These membranes may be permeable, semipermeable, perforated or unperforated and can deliver an active substance by the combined mechanisms of diffusion and osmotic pumping. The asymmetric membranes may be made with 398-10 cellulose acetate from Eastman. EP 636366 and EP 553392 disclose an active agent composition

10 coated with an aqueous dispersion of plasticized acrylic polymer, which is subjected to a particular curing process. The resulting controlled release formulation has a stable dissolution profile despite exposure to a variety of storage conditions. U.S. Patent No. 5,543,155 discloses a controlled delivery pharmaceutical composition core surrounded by a wall comprising an ammonium methacrylate copolymer that is permeable to low molecular weight

15 molecules. This controlled delivery pharmaceutical composition contains an active pharmaceutical compound and hydroxypropyl methylcellulose (HPMC) as the hydrophilic polymer. Tablets having a bi-layered core are prepared with a hydrophilic polymer layer comprising high molecular weight HPMC having a viscosity higher than 1000 cP in a 2% aqueous solution. Suitable devices and formulations of this and related types may be used to

20 deliver a compound of Formula (1.0.0).

Osmotic devices of this type have a bi-layered core, one layer containing the active agent and the other being a swellable placebo layer, surrounded by a semipermeable membrane. The placebo layer consists mainly of a swellable polymer and/or a hydrogel that, while absorbing fluid from the environment of use, expands and exerts pressure over the

25 layer that contains the active agent thereby releasing the active agent through a passageway in the wall. The art teaches that perforation of the semipermeable membrane should be carried out selectively on the side of the membrane that is adjacent to the layer comprising the active agent. In fact, if the membrane is perforated adjacent the placebo layer, the active agent will not be released. If two perforations are carried out, one adjacent the active-agent

30 layer and the other adjacent the swellable polymer layer, referred to as the "push" layer, both the active agent and the swellable polymer are released, resulting in loss of the "push" effect. U.S. Patent No. 5,543,155 also discloses perforation of the membrane adjacent both layers of the core; however, a specific high molecular weight polymer is required to prevent the loss of the push layer leaving a significant number of available hydrophilic polymers unavailable for

35 use in these devices. U.S. Patent No. 5,516,527 discloses a device that can include a preformed passageway and plural pores. The device requires the formation of a phase separated coating that ultimately forms a porous membrane.

Another device that would be suitable for controlled release of a compound of Formula (1.0.0) comprises a) a core located approximately at the center of the device consisting of an expandable hydrophilic polymer and optionally an osmagent, the core being able to absorb and/or imbibe fluids from the environment of use; b) a composition immediately surrounding the core consisting of a compound of Formula (1.0.0) and, optionally, an osmagent and/or an osmopolymer; c) a membrane immediately surrounding the composition consisting of a mixture of a cellulose acylate (ester), a methacrylate salt copolymer and a plasticizer, where the membrane permits delivery of a compound of Formula (1.0.0) through a combination of diffusion and osmotic pumping; and d) at least one preformed passageway and plural micropores in the membrane that communicate the composition with the outside of the device. The micropores in the wall are formed during preparation of the wall or during exposure to fluids in an intended environment of use. Methods of preparing walls wherein the micropores form in the environment of use are well known and described in, among others, U.S. Patents Nos. 3,845,770; 3,916,899; 4,063,064; 4,088,864; 4,816,263; 4,200,098; 4,285,987; and 5,912,268.

Osmagents or osmotically effective compounds are generally soluble in the fluid that enters into a device of the type described above through a wall thereof, creating an osmotic pressure gradient across the wall. The fluid and components of the device layer will generally form a solution or suspension comprising a compound of Formula (1.0.0) to be delivered. Exemplary osmagents include high or low molecular weight compounds, organic and inorganic compounds such as salts, acids, bases, chelating agents, sodium chloride, lithium chloride, magnesium chloride, magnesium sulfate, lithium sulfate, potassium chloride, sodium sulfite, calcium bicarbonate, sodium sulfate, calcium sulfate, calcium lactate, d- mannitol, urea, tartaric acid, raffinose, sucrose, alpha-d-lactose monohydrate, glucose, combinations thereof and other similar or equivalent materials known in the art. Preferred osmagents include potassium chloride, sodium tartrate, glucose, mannitol, sodium acetate, sodium chloride, sodium sulfate, sodium citrate, potassium tartrate, sorbitol, sucrose and combinations thereof. The device layer comprising a compound of Formula (1.0.0) can also comprise an osmopolymer such as those used for the core, preferably poly(alkylene oxide) and, more preferably, poly(ethylene oxide) with an average molecular weight between about 100,000 and 8,000,000.

It is known in the art that it is desirable to have a method for reducing the severity of or eliminating or avoiding the occurrence of one or more side effects of a therapeutic agent which inhibits PDE4, and that one of these methods comprises administering the therapeutic agent in a controlled release formulation which results in a delay in the appearance in the plasma of detectable amounts of said therapeutic agent and results in a reduction of rate of rise in plasma concentration of said therapeutic agent by at least about 10%, as compared

- 208 -

with that of an immediate release formulation containing the same amount of therapeutic agent administered by the same route. At least a 10 minute delay in onset of increasing plasma concentrations is a preferred practice, although a delay of somewhere between 10 and 45 minutes, say 30 minutes, or greater (1 hour or more) are also useful and practicable.

- 5 This timing of delay can be measured by reference to the onset of absorption as measured against an immediate release (IR) tablet, although an IR formulation is but one possible standard.

- A 10% reduction in rate of rise of plasma concentration of therapeutic agent is a threshold for eliminating or reducing their occurrence or severity side effects with a given dose of therapeutic agent or for increasing the amount of therapeutic agent that is administered, either at a single point in time or when a titration or infusion technique is used. Such reduction is determined by comparison to an immediate release preparation administered by the same route. For example, if the oral route of administration is chosen as the approach to be taken, then an immediate release tablet or capsule is the standard against which to measure the 10% reduction in rate of rise.
- 10
- 15

- A preferred methodology for reducing the rate of rise and/or delaying onset of absorption is the controlled release technologies. This involves formulating the therapeutic agent with excipients, which modulate and extend the period over which the active ingredient is released from the carrier. This type of formula is sometimes described as a sustained release formulation or a non-immediate release delivery system. "Controlled release" is intended to cover any formulation which can be characterized as having a release profile wherein a portion of its drug load is released over time, either episodically or continuously over time. It also includes preparations where the initial release of therapeutic agent is delayed as a result of an external barrier or coating which is selectively soluble in the environment where the formulation is placed, or a preparation where the coating does not break down in the environment into which the formulation is initially introduced, but then migrates to another environment in which the external coating is soluble or is broken down, after which the drug is released over time. By way of further illustration and explanation, these delivery systems can be characterized as: i) delayed release, ii) controlled or prolonged release, iii) site-specific release, or iv) receptor release.
- 20
- 25
- 30

- A more detailed explanation of these different systems is available in the likes of Remington's Pharmaceutical Sciences, 18th Edition, Mack Publishing Co. Easton, Pennsylvania, U.S.A. 18042, or later additions of Drugs and Pharmaceutical Sciences, v 29: "Controlled Drug Delivery: Fundamentals and Applications, Second Edition" edited by Joseph R. Robinson and Vincent H. Lee, published by Marcel Dekker Inc. These systems may be dissolution-dependent as illustrated by encapsulated dissolution products or matrix dissolution
- 35

products. Or, they may be formulated using osmotic systems or ion exchange resins. The most preferred approach is to provide an oral controlled release product based on matrix dissolution technology.

5 A delay in onset of absorption and a reduced rate of absorption may be correlated with reduced side effects when a known PDE4 inhibitor is administered to patients in an oral controlled release preparation containing three times the amount of therapeutic agent as that of an immediate release tablet which was not well tolerated. It will also be observed that the controlled tablet results in a reduced rate of absorption, which is reflected in a reduced rate of rise in plasma concentrations but gives a Cmax several hours later which exceeds the Cmax associated with adverse side effects in an immediate release tablet. That is, when an immediate release tablet is given to a patient, the Cmax and side effects correlate strongly. This correlation was not observed with the controlled release formulation even though it resulted in a higher Cmax. It is not clear whether the results seen with a controlled release preparation are dependent on or related to one or both of these observations, or to another factor or combination of factors, such as Tmax, ka, Tlag (absorption lag-time), or some other factor or phenomenon. Regardless of what the underlying mechanism is, the result is that it is now possible to significantly increase the amount of PDE4 inhibitor administered at a particular time point and avoid the tolerability challenges associated with PDE4 inhibitors in certain segments of the population.

20 Controlled release preparations can be prepared by selecting excipients from any number or type of materials which provide the requisite controlled release profile needed to avoid side effects while allowing for a significant increase in the amount of therapeutic agent contained in the formulation, as compared with an immediate release preparation. A preferred approach is to use a matrix dissolution technology based on acrylic acid polymers. Carbomer is the non-proprietary name for these materials. They are high molecular weight polymers prepared by cross linking acrylic acids with the likes of allylsucrose or allyl ethers of pentaerythritol. Such polymers also go by the name acritamer or carbopol. The chemical name and CAS registry number for the class is carboxypolymethylene [54182-57-91]. Exemplary carbomers are carbomer 910 [91315-32-1], carbomer 934 [9007-16-3], carbomer 934P [9003-01-4] and carbomer 940 [76050-42-5]. These polymers contain between 56-68% of carboxylic acid groups, calculated on a dry basis. A blend of two or more carbomers of differing molecular weight can be used to modify and manipulate the release rate.

35 The preferred excipients for affecting release rate are carbomers, particularly a combination of two or more different carbomers. Especially preferred are those carbomers known as Carbopols and manufactured by BF Goodrich. Preferred carbomers are: Carbomer 934P (Carbopol 974P), and Carbomer 94 1 P (Carbopol 97 1 P).

- 210 -

A preferred formulation will have between about 1-25% by weight of therapeutic agent, preferably an amount between 3-20% and optionally an amount between about 5 and 15%.

5 **DETAILED DESCRIPTION OF THE INVENTION**
11.0 Preparations and Working Examples

Preparation 1a

2-[Benzo[2,1,3]oxadiazol-5-yloxy]-nicotinic acid ethyl ester of Formula (5.0.1):

(5.0.1)

10 A mixture of 5.5 g (29.4 mmol.) 2-chloro nicotinic acid ethyl ester, 4.0 g (29.4 mmol.) 5-hydroxybenzofurazan and 20.1 g (61.7 mmol.) cesium carbonate in 125 ml dry dimethylformamide was heated at 90°C for five days. The mixture was poured into water and
15 extracted with ethyl acetate. The ethyl acetate extracts were combined, washed successively with sodium bicarbonate solution, water, brine then dried (Na₂SO₄) and concentrated *in vacuo* to give a solid. Recrystallization from diethyl ether/pentane gave 2.2 g (26%) solid.

¹H-NMR (CDCl₃): δ 8.3 (m, 2H), 7.8 (d, 1H, J=10 Hz), 7.2 (m, 3H), 4.4 (q, 2H, J=7 Hz), 1.4 (t, 3H, J=7 Hz).

20 GC-MS (m/z): 285 (M⁺, 20), 122 (100).

Preparation 1b

2-[Benzo[2,1,3]oxadiazol-5-yloxy]-nicotinic acid of Formula (5.0.2):

- 211 -

(5.0.2)

A mixture of 2.2 g (7.7 mmol.) 2-[benzo[2,1,3]oxadiazol-5-yloxy]-nicotinic acid ethyl ester and 23.1 ml (23.1 mmol.) 1M LiOH in 75 ml tetrahydrofuran was stirred overnight at room temperature. The tetrahydrofuran was evaporated *in vacuo* and the aqueous mixture
 5 acidified with 1N HCl. The resulting precipitate was filtered and dried to give 1.9 g (96%) solid.

¹H-NMR (CH₃OD): δ 8.4 (d, 1H, J=8 Hz), 8.3 (dd, 1H, J=2, 5 Hz), 8.0 (d, 1H, J=9 Hz), 7.6 (s, 1H), 7.5 (d, 1H, J=9 Hz), 7.2 (dd, 1H, 5, 8 Hz).

10 MS (m/z): 257 (M⁺, 20), 256 (100).

Preparation 2

Benzo-[2,1,3]-thiadiazol-5-ol of Formula (5.0.3):

15

(5.0.3)

5-Methoxybenzo-2,1,3-thiadiazole (4.09 g, 24.6 mmol) was stirred with hydrobromic acid (60 mL, 165 mmol, 30% in acetic acid) at 80 °C 5 days. The mixture was cooled to 10 °C and filtered. The solids were purified by short column chromatography (50% ethyl acetate / hexane). Solvents were stripped *in vacuo* to afford 1.0 g of a yellow solid (27% yield).

20 ¹H NMR (CD₃OD): δ 7.81 (d, 1H, J= 2 Hz), 7.79 (d, 1H, J= 2 Hz), 7.30 (s, 1H).

Preparation 3

2-(Benzo[2,1,3]thiadiazol-5-yloxy)-nicotinic acid ethyl ester of Formula (5.0.4):

- 212 -

(5.0.4)

5 A mixture of 2-chloro-nicotinic acid ethyl ester (0.516 g, 3 mmol), benzo-[2,1,3]-thiadiazol-5-ol (0.46 g, 3 mmol) and cesium carbonate (2.07 g, 6.3 mmol) was stirred in 40 mL *N,N*-dimethylformamide at 80 °C for 48 hours. The dark orange mixture was cooled and poured into water (600 mL) and extracted with ethyl acetate. The combined organic layers were washed with water and brine, and dried (Na_2SO_4). The mixture was concentrated *in vacuo* to give 0.74 g yellow solid (82 % yield).

MS (*m/z*): 302 (M^+ , 20), 227 (100).

10

Preparation 4

2-(Benzo[2,1,3]thiadiazol-5-yloxy)-nicotinic acid of Formula (5.0.5):

(5.0.5)

15 A solution of 2-(benzo[2,1,3]thiadiazol-5-yloxy)-nicotinic acid ethyl ester (0.74 g, 2.5 mmol) in tetrahydrofuran (2.78 ml) and 1 M LiOH (2.7 ml) was stirred over night. The mixture was diluted with water and acidified to pH 1 with 2 N hydrochloric acid and filtered to give a pale yellow solid (160 mg).

20 ^1H NMR (CD_3OD): δ 8.37 (d, 1H, J = 6 Hz), 8.26 (dd, 1H, J = 2 Hz, 5 Hz), 8.00 (d, 1H, J = 9 Hz), 7.60 (t, 1H, J = 2 Hz), 7.50 (t, 1H, J = 2 Hz), 7.26 (d, 1H, J = 8 Hz).

Preparation 5

2-(Benzo-[1,3]dioxol-5-yloxy)-nicotinic acid of Formula (5.0.6):

- 213 -

(5.0.6)

2-Chloro-nicotinic acid ethyl ester (10 g), benzo[1,3]dioxol-5-ol (sesamol, 8.2 g), and cesium carbonate (21 g) were mixed in anhydrous dioxane (40 mL) and the resulting slurry heated to reflux for 16 h. In a separate flask, lithium hydroxide (12.9 g) was dissolved in water (80 mL) with warming and then added to the refluxing mixture, which was heated for an additional 4 h. The mixture was cooled to ambient temperature and concentrated in vacuo to remove the dioxane. Concentrated hydrochloric acid was added dropwise until the pH = 3. The acidified solution was then extracted with ethyl acetate (7 x 100 mL) to yield crude product, which was recrystallized from ethyl acetate to yield the purified title compound (10.8 g).

¹H NMR (CD₃OD): δ 8.28 (dd, J = 8 and 2 Hz, 2H), 7.13 (m, 1H), 6.79 (d, J = 8 Hz, 1H), 6.62 (s, J = 2 Hz, 1H), 6.53 (dd, J = 8 and 2 Hz, 1H), 5.95 (s, 2H).

Preparation 6

2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-nicotinic acid of Formula (5.0.7):

(5.0.7)

2-Chloro-5-fluoro-nicotinic acid (synthesized in accordance with the procedures described in European patent: EP 0634413 A1) was converted to the corresponding ethyl ester with anhydrous ethanol and excess thionyl chloride, then worked up in the usual manner. To 2-chloro-5-fluoro-nicotinic acid ethyl ester (5.0 g) in an oven-dried 250 mL flask was added cesium carbonate (9.60 g), sesamol (4.07 g), and 50 mL of anhydrous dioxane. The reaction was stirred overnight at 100°C. Lithium hydroxide (2.94 g) in 10 mL water was added, and the reaction was again allowed to stir overnight at 100°C. The dioxane was then evaporated under a nitrogen stream. The residue was then taken up in 50 mL water, acidified with conc.

- 214 -

hydrochloric acid to pH = 3, and extracted with ethyl acetate (3 x 100 mL). The combined organic extracts were dried over magnesium sulfate, filtered, and concentrated in vacuo. The dried residue was washed with ethyl acetate (20 mL) and dried under high vacuum, giving the title compound (2.96 g).

- 5 ^1H NMR (CD_3OD) δ 8.09-8.04 (m, 2H), 6.76 (d, J = 9Hz, 1H), 6.61 (s, 1H), 6.51 (d, J = 7, 1H), 5.93 (s, 2H).

MS m/z 278 ($M + H$) $^+$.

Preparation 7

- 10 2-(4-Fluoro-phenoxy)-nicotinic acid of Formula (5.0.8):

(5.0.8)

- 2-Chloro-nicotinic acid ethyl ester, 4-fluoro-phenol, and cesium carbonate were mixed in anhydrous dioxane and the resulting slurry heated to reflux for about 16 h. In a separate flask, lithium hydroxide was dissolved in water with warming and then added to the refluxing mixture, which was heated for an additional 4 h. The mixture was cooled to ambient temperature and concentrated in vacuo to remove the dioxane. Concentrated hydrochloric acid was added dropwise until the pH = 3. The acidified solution was then extracted with ethyl acetate to yield crude product, which was recrystallized from ethyl acetate to yield the purified title compound (10.8 g).

MS m/z 232 ($M-H$) $^+$

- 215 -

Preparation 8

2-(3-Cyano-phenoxy)-nicotinic acid of Formula (5.0.9):

(5.0.9)

- 5 The compound of Formula (5.0.9) was prepared in a manner analogous to that described in Preparation 7 above, replacing the 4-fluoro-phenol with 3-cyano-phenol.

Preparation 9(±)-2-(4-Cyano-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester of Formula (5.0.10):

10

(5.0.10)

- 2-Fluoro-4-hydroxybenzonitrile (1 g, 7.29 mmol) was dissolved in *N, N*-dimethyl-formamide (20 mL) and stirred with potassium carbonate (1.1 g, 8.0 mmol) at rt for 2h. (±) 2-Bromopropionic acid *tert*-butyl ester (1.67 g, 8.0 mmol) was added and the reaction was stirred at rt for 72 hours. The reaction was quenched into dilute aqueous hydrochloric acid and extracted 2x with ethyl acetate. The pooled organics were dried (Na₂SO₄) and adsorbed onto silica gel, followed by purification by flash column chromatography (20% ethyl acetate/hexane) to afford 1.8 g colorless oil (93% yield).

- ¹H NMR (CDCl₃): δ 7.48 (t, 1H, J= 7.5 Hz), 6.68 (d, 1H, J= 9 Hz), 6.64 (d, 1H, J= 11 Hz), 4.55 (q, 1H, J= 7 Hz), 1.58 (d, 3H, J= 7 Hz), 1.41 (s, 9H).

20

Preparation 10

(±)-2-(4-Aminomethyl-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester of Formula (5.0.11):

(5.0.11)

- 5 (±)-2-(4-Cyano-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester (1.77 g, 6.7 mmol) was shaken on a Parr shaker under 40 psi hydrogen for 30 min, using palladium hydroxide on carbon (1 g, 30% Pd by wt) in 200 mL anhydrous methanol. The reaction mixture was filtered through sintered glass, and solvents removed *in vacuo* to afford 1.71 g colorless oil (95% yield).
- 10 MS (m/z): 269 (M^+ , 45), 168 (100).

Preparation 11

(R)-2-(4-Cyano-3-fluoro-phenoxy)-propionic acid methyl ester of Formula (5.0.12):

(5.0.12)

- 15 To a stirred solution of 2-fluoro-4-hydroxybenzonitrile (0.2 g, 1.5 mmol), methyl (*S*)-(-)-lactate (0.14 mL, 1.5 mmol) and triphenylphosphine (1.15 g, 4.4 mmol) at room temperature, diethyl azodicarboxylate (0.67 mL, 4.4 mmol) was added dropwise. The mixture was stirred at room temperature overnight, diluted with ethyl acetate and washed successively with dilute aqueous sodium hydroxide, dilute aqueous hydrochloric acid, brine, and dried (Na_2SO_4).
- 20 Solvents were stripped *in vacuo*. The resulting oil was washed with diethyl ether and the precipitate was filtered off. The mother liquor was adsorbed onto silica gel and the product purified by flash column chromatography (20% dichloromethane/hexane), affording 0.12 g of a pink oil (36% yield).
- 25 ^1H NMR (CDCl_3): δ 7.51 (t, 1H, J = 7.5 Hz), 6.71 (d, 1H, J = 9 Hz), 6.67 (d, 1H, J = 10 Hz), 4.78 (q, 1H, J = 7 Hz), 3.77 (s, 3H), 1.64 (d, 3H, J = 7 Hz).

- 217 -

Preparation 12

(R)-2-(4-Aminomethyl-3-fluoro-phenoxy)-propionic acid methyl ester of Formula (5.0.13):

(5.0.13)

- 5 The compound of Formula (5.0.13) was prepared in a manner analogous to that described in Preparation 10, substituting (R)-2-(4-cyano-3-fluoro-phenoxy)-propionic acid methyl ester for the corresponding *tert*-butyl ester material.

¹H NMR (CDCl₃): δ 7.41 (t, 1H, J= 8 Hz), 6.90 (br, 2H), 6.58 (m, 2H), 4.69 (q, 1H, J= 7 Hz), 4.00 (s, 2H), 3.71 (s, 3H), 1.56 (d, 3H, J= 7 Hz).

10

Preparation 13

(S)-2-(4-Cyano-3-fluoro-phenoxy)-propionic acid methyl ester of Formula (5.0.14):

(5.0.14)

- 15 The compound of Formula (5.0.14) was prepared in a manner analogous to that described in Preparation 11, substituting methyl (R)-(+)-lactate for the methyl (S)-(—)-lactate.

¹H NMR (CDCl₃): δ 7.51 (t, 1H, J= 7.5 Hz), 6.72 (d, 1H, J= 9 Hz), 6.67 (d, 1H, J= 10 Hz), 4.78 (q, 1H, J= 7 Hz), 3.77 (s, 3H), 1.64 (d, 3H, J= 7 Hz).

- 218 -

Preparation 14

(S)-2-(4-Aminomethyl-3-fluoro-phenoxy)-propionic acid methyl ester of Formula (5.0.15):

(5.0.15)

- 5 The compound of Formula (5.0.15) was prepared in a manner analogous to that described in Preparation 12, based on Preparation 10, substituting (-)-2-(4-cyano-3-fluoro-phenoxy)-propionic acid methyl ester for the corresponding (+) material.

^1H NMR (CDCl_3): δ 7.41 (t, 1H, $J = 8$ Hz), 6.90 (br, 2H), 6.58 (m, 2H), 4.69 (q, 1H, $J = 7$ Hz), 4.00 (s, 2H), 3.71 (s, 3H), 1.56 (d, 3H, $J = 7$ Hz).

10

Preparation 15

(R)-2-(4-Cyano-3-fluoro-phenoxy)-propionic acid of Formula (5.0.16):

(5.0.16)

- 15 To a stirred solution of (R)-2-(4-cyano-3-fluoro-phenoxy)-propionic acid methyl ester (0.40 g, 1.8 mmol) in 50 mL 1:1 tetrahydrofuran/methanol at room temperature was added lithium hydroxide (5.5 mL 1 M aqueous solution, 5.5 mmol) and the solution was stirred over night. The reaction was quenched into dilute aqueous hydrochloric acid and extracted with ethyl acetate. The organic layers were pooled and washed with brine, dried (Na_2SO_4) and concentrated *in vacuo* to afford a colorless oil (0.37 g, 98%).
- 20

^1H NMR (CDCl_3): δ 7.50 (t, 1H, $J = 7$ Hz), 6.69 (m, 2H), 4.81 (q, 1H, $J = 7$ Hz), 1.68 (d, 3H, $J = 7$ Hz).

- 219 -

Preparation 16(R)-2-(4-Cyano-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester of Formula (5.0.17):

(5.0.17)

- 5 A solution of (R)-2-(4-cyano-3-fluoro-phenoxy)-propionic acid (55 mg, 0.26 mmol) in dry toluene (30 mL) and *N,N*-dimethylformamide di-*tert*-butyl acetal (0.25 mL, 1.05 mmol) was stirred at 90 °C 1 hour. The reaction mix was adsorbed onto silica gel and purified by flash column chromatography (30% ethyl acetate/hexane) to afford 51 mg of a white solid (74% yield).
- 10 ¹H NMR (CDCl₃): δ 7.48 (t, 1H, J = 7 Hz), 6.65 (m, 2H), 4.61 (q, 1H, J = 7 Hz), 1.58 (d, 3H, J = 7 Hz), 1.41 (s, 9H).

Preparation 17

(4-Cyano-3-fluoro-phenoxy)-acetic acid methyl ester of Formula (5.0.18):

15

(5.0.18)

The compound of Formula (5.0.18) was prepared in a manner analogous to that described in Preparation 9, substituting bromoacetic acid methyl ester for the bromopropionic acid *tert*-butyl ester material.

- 20 MS (m/z): 209 (M⁺, 100).

- 220 -

Preparation 18

(4-Aminomethyl-3-fluoro-phenoxy)-acetic acid methyl ester of Formula (5.0.19):

(5.0.19)

- 5 The compound of Formula (5.0.19) was prepared in a manner analogous to that described in Preparation 10, substituting (4-cyano-3-fluoro-phenoxy)-acetic acid methyl ester for the corresponding 2-(4-cyano-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester material.

MS (m/z): 212 (M^+ , 100).**Preparation 19**(R)-2-(4-Aminomethyl-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester of Formula (5.0.20):

(5.0.20)

- 15 The compound of Formula (5.0.20) was prepared in a manner analogous to that described in Preparation 10, substituting (R)-2-(4-Cyano-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester for the corresponding (\pm)-2-(4-cyano-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester material.

^1H NMR (CDCl_3): δ 7.17 (t, 1H, $J = 9$ Hz), 6.55 (t, 2H, $J = 8$ Hz), 4.53 (q, 1H, $J = 7$ Hz), 3.78 (s, 2H), 2.57 (br, 2H), 1.52 (d, 3H, $J = 7$ Hz), 1.39 (s, 9H).

- 221 -

Preparation 20

[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluoro-phenoxy]-acetic acid methyl ester of Formula (5.0.21):

5

(5.0.21)

2-(Benzo-[1,3]-dioxol-5-yloxy)-nicotinic acid (0.31 g, 1.1 mmol), (4-aminomethyl-3-fluoro-phenoxy)-acetic acid methyl ester (0.46 g, 2.15 mmol), 1-hydroxybenzotriazole hydrate (0.16 g, 1.2 mmol), and 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (0.23 g, 1.2 mmol) were dissolved in 1:1 *N,N*-dimethylformamide / dichloromethane (40 mL) and stirred at room temperature over night. Solvents were removed *in vacuo*. The residue was taken up in ethyl acetate and washed successively with dilute aqueous hydrochloric acid, dilute aqueous sodium hydroxide, and brine, and dried (Na_2SO_4). The product was purified by flash column chromatography (20% ethyl acetate/hexane) to afford a yellow oil (0.19 g, 38%).

10

MS (*m/z*): 455 ($\text{M}^+ + 1$, 100).

15

Preparation 21

(\pm)-2-[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluoro-phenoxy]-propionic acid *tert*-butyl ester of Formula (5.0.22):

20

(5.0.22)

The compound of Formula (5.0.22) was prepared in a manner analogous to that described in Preparation 20, substituting (\pm)-2-[4-aminomethyl-3-fluoro-phenoxy]-propionic acid *tert*-butyl ester for the (4-aminomethyl-3-fluoro-phenoxy)-acetic acid methyl ester material.

- 222 -

¹H NMR (CDCl₃): δ 8.58 (dd, 1H, J= 2 Hz, 8 Hz), 8.19 (dd, 2H, J= 2 Hz, 5 Hz), 7.26 (m, 1H), 7.10 (m, 1H), 6.78 (d, 1H, J= 8 Hz), 6.63 (d, 1H, J= 2 Hz), 6.55 (m, 2H), 5.99 (s, 2H), 4.62 (d, 2H, J= 5 Hz), 4.51 (q, 1H, J= 7 Hz), 1.53 (d, 3H, J= 7 Hz), 1.40 (s, 9H).

5 Preparation 22

(±)-2-[4-({[2-(Benzo[2,1,3]oxadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid *tert*-butyl ester of Formula (5.0.23):

(5.0.23)

- 10 The compound of Formula (5.0.23) was prepared in a manner analogous to that described in Preparation 20, substituting 2-(benzo[2,1,3]oxadiazol-5-yloxy)-nicotinic acid and (±)-2-(4-aminomethyl-3-fluoro-phenoxy)-propionic acid *tert*-butyl ester for the corresponding 2-(benzo[1,3]-dioxol-5-yloxy)-nicotinic acid and (4-aminomethyl-3-fluoro-phenoxy)-acetic acid methyl ester materials, respectively.

- 15 ¹H NMR (CDCl₃): δ 8.62 (dd, 1H, J= 2 Hz, 5 Hz), 8.18 (dd, 1H, J= 2 Hz, 5 Hz), 7.88 (t, 1H, J= 5 Hz), 7.85 (dd, 1H, J= 1 Hz, 9 Hz), 7.54 (s, 1H), 7.23 (m, 2H), 6.55 (m, 2H), 4.64 (d, 2H, J= 6 Hz), 4.52 (q, 1H, J= 7 Hz), 1.53 (d, 3H, J= 7 Hz), 1.39 (s, 9H).

(5.0.33)

The compound of Formula (5.0.33) was prepared in a manner analogous to that described in Preparation 20, substituting 2-(benzo[2,1,3]thia-diazol-5-yloxy)-nicotinic acid and (R)-2-(4-aminomethyl-3-fluoro-phenoxy)-propionic acid methyl ester for the corresponding 2-(benzo[1,3]-dioxol-5-yloxy)-nicotinic acid and (4-aminomethyl-3-fluoro-phenoxy)-acetic acid methyl ester materials, respectively.

¹H NMR (CDCl₃): δ 8.62 (dd, 1H J= 2, 8 Hz), 8.17 (dd, 1H, J= 2, 5 Hz), 8.10 (t, 1H, J= 5 Hz), 8.00 (dd, 1H, J= 1, 10 Hz), 7.74 (d, 1H, J= 3 Hz), 7.39 (dd, 1H, J= 2, 9 Hz), 7.30 (t, 1H, J= 9 Hz), 7.20 (m, 1H), 6.56 (m, 2H), 4.66 (m, 3H), 3.70 (s, 3H), 1.56 (d, 3H, J= 7 Hz).

Preparation 33

(R)-2-[4-({[2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluorophenoxy]-propionimidic acid ethyl ester of Formula (5.0.34):

5

(5.0.34)

To a stirred solution of (R)-2-(benzo[1,3]dioxol-5-yloxy)-N-[4-(1-carbamoyl-ethoxy)-2-fluorobenzyl]-nicotinamide (0.4 g, 0.88 mmol) in dichloromethane (20 ml) triethyloxonium tetrafluoroborate (0.17 g, 0.88 mmol) was added. The reaction was stirred at room temperature 16h. The reaction was adsorbed onto a small amount of silica gel and column chromatography (2% methanol/dichloromethane) afforded 160 mg of the desired product as a colorless oil (38% yield).

10

MS (m/z): 481 (M^+ , 100).

Preparation 34

15 (R)-2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(1-thiocarbamoyl-ethoxy)-benzyl]-nicotinamide of Formula (5.0.35):

(5.0.35)

A solution of (R)-2-(benzo[1,3]dioxol-5-yloxy)-N-[4-(1-carbamoyl-ethoxy)-2-fluorobenzyl]-5-fluoro-nicotinamide (1.0 g, 2.12 mmol) and Lawesson's reagent (0.52 g, 1.27 mmol) in dry tetrahydrofuran (10 ml) was stirred at room temperature 2 h. The solvent was removed *in vacuo*. The residue was adsorbed onto silica gel and purified by column chromatography (20% ethyl acetate/hexane) to afford 1.01 g of a yellow solid (98% yield).

20

- 229 -

MS (m/z): 486 (M^+ , 100).**Preparation 35**

2-(Benzo[1,3]dioxol-5-yloxy)-N-(2-fluoro-4-hydroxy-benzyl)-nicotinamide of Formula (5.0.36):

(5.0.36)

A solution of 4-aminomethyl-3-fluoro-phenol hydrochloride (4.75 g, 27 mmol) in *N,N*-dimethylformamide (20 ml) was added to a stirred solution of 2-(benzo-[1,3]-dioxol-5-yloxy)-nicotinic acid (14 g, 54 mmol), 1-hydroxybenzotriazole hydrate (7.29 g, 54 mmol), 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (10.37 g, 54 mmol), and triethylamine (3.76 ml, 27 mmol) in *N,N*-dimethylformamide (130 ml) at room temperature and stirred over night. The reaction was quenched into dilute aqueous hydrochloric acid and extracted with diethyl ether, then ethyl acetate. The pooled organic layers were washed successively with dilute aqueous sodium hydroxide, water, and brine. The solvents were stripped *in vacuo* to afford 12.2 g crude. The residue was dissolved in methanol (100 ml) and stirred with lithium hydroxide (10 ml, 1M) for 1 h to hydrolyze the ester of the *bis*-acylated product. Solvents were stripped *in vacuo*, the residue was diluted with water (200 ml) and saponified to pH 12 with sodium hydroxide. The precipitate was filtered off, and the filtrate was acidified to pH 1 with concentrated hydrochloric acid and extracted with ethyl acetate (2x 200 ml). The pooled organics were washed with 2N sodium carbonate, then brine and dried ($MgSO_4$). The solvents were stripped *in vacuo* to afford pure product (5.7 g, 14.9 mmol) in 55% yield.

1H NMR ($CDCl_3$): 8.53 (dd, 1H, $J = 2$ Hz, 8 Hz), 8.16 (dd, 1H, $J = 2$ Hz, 5 Hz), 7.11 (m, 2H), 6.78 (d, 1H, $J = 8$ Hz), 6.61 (d, 1H, $J = 2$ Hz), 6.52 (m, 3H), 5.97 (s, 2H), 4.57 (s, 2H).

MS (m/z): 383 ($M^+ + 1$, 10).

Preparation 36

(±)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[4-(1-cyano-ethoxy)-2-fluoro-benzyl]-nicotinamide of Formula (5.0.37):

5

(5.0.37)

To a stirred solution of 2-(benzo[1,3]dioxol-5-yloxy)-N-(2-fluoro-4-hydroxy-benzyl)-nicotinamide (5 g, 13.1 mmol), (+/-)-lactonitrile (0.93 g, 13.1 mmol) and triphenylphosphine (3.78 g, 14.4 mmol) in tetrahydrofuran (200 mL) at room temperature, diethyl azodicarboxylate (2.3 mL, 14.4 mmol) was added dropwise with stirring. The mixture was stirred at room temperature overnight. Solvents were stripped *in vacuo*, diluted with ethyl acetate and washed with dilute aqueous sodium hydroxide, brine, and dried (MgSO₄). Solvents were stripped *in vacuo*. The resulting oil was washed with diethyl ether and the precipitate was filtered off. The mother liquor was purified by flash column chromatography (35% ethyl acetate/hexane), affording 1.5 g white solid (26% yield).

¹H NMR (CDCl₃): 8.59 (d, 1H, J=8 Hz), 8.28 (t, 1H, J= 6 Hz), 8.21 (dd, 1H, J= 2 Hz, 4 Hz), 7.40 (t, 1H, J= 8 Hz), 7.12 (dd, 1H, J= 5 Hz, 8 Hz), 6.82 (d, 1H, J= 8 Hz), 6.66 (m, 3H), 6.00 (s, 2H), 4.83 (q, 1H, J= 7 Hz), 4.66 (d, 2H, J= 6 Hz), 1.76 (d, 3H, J= 7 Hz).

Preparation 37

(S)-3-(4-Cyano-3-fluoro-phenoxy)-2-methyl-propionic acid methyl ester of Formula (5.0.38):

(5.0.38)

To a stirred solution of 2-fluoro-4-hydroxybenzonitrile (1.0 g, 7.3 mmol), (S)-3-hydroxy-2-methyl-propionic acid methyl ester (0.8 mL, 7.3 mmol) and triphenylphosphine (2.3 g, 8.8 mmol) at room temperature, diethyl azodicarboxylate (1.4 mL, 8.8 mmol) was added dropwise. The mixture was stirred at room temperature overnight, diluted with ethyl acetate

- 231 -

and washed successively with dilute aqueous sodium hydroxide, dilute aqueous hydrochloric acid, brine, and dried (MgSO_4). Solvents were stripped *in vacuo*. The resulting oil was washed with diethyl ether and the precipitate was filtered off. The mother liquor was adsorbed onto silica gel and the product purified by flash column chromatography (40% ethyl acetate/hexane), affording 0.14 g of a yellow oil (8% yield).

^1H NMR (CDCl_3): 7.49 (t, 1H, $J = 8$ Hz), 6.73 (d, 1H, $J = 9$ Hz), 6.70 (d, 1H, $J = 9$ Hz), 4.21 (dd, 1H, $J = 7, 9$ Hz), 4.01 (dd, 1H, $J = 6, 9$ Hz), 3.71 (s, 3H), 2.95 (m, 1H), 1.29 (d, 3H, $J = 7$ Hz).

Preparation 38

- 10 (S)-3-(4-Aminomethyl-3-fluoro-phenoxy)-2-methyl-propionic acid methyl ester hydrochloride of Formula (5.0.39):

(5.0.39)

- 15 (S)-3-(4-Cyano-3-fluoro-phenoxy)-2-methyl-propionic acid methyl ester (0.14 g) was shaken on a Parr shaker under 50 psi hydrogen for 16 h, using palladium hydroxide on carbon (0.01 g, 30% Pd by wt) in anhydrous methanol (20 mL) and concentrated hydrochloric acid (0.5 mL). The reaction mixture was filtered through sintered glass, and solvents removed *in vacuo* to afford 0.18 g of a white solid (95% yield).

MS (m/z): 241 (M^+ , 100).

20

Example 1

- 25 [4-(((2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl)-amino)-methyl)-3-fluoro-phenoxy]-acetic acid of Formula (5.5.1):

(5.5.1)

- 232 -

To a stirred solution of [4-({[2-(benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-acetic acid methyl ester (0.40 g, 0.88 mmol) in tetrahydrofuran (10 mL) and methanol (2 mL) was added aqueous lithium hydroxide (2 mL, 1 M, 2 mmol). The reaction was stirred at room temperature 1 hour. The solvents were stripped *in vacuo* and the residue

5 partitioned between dilute aqueous hydrochloric acid and ethyl acetate. The aqueous was extracted with 2 allquots ethyl acetate and the pooled organics were washed with brine, dried over sodium sulfate and concentrated *in vacuo* to afford a yellow solid. The crude product was recrystallized from ethyl acetate to afford 80 mg of a white crystalline solid (0.18 mmol, 21% yield). mp 180 °C.

10 ¹H NMR (CD₃OD): δ 8.52 (dd, 1H, J= 2, 8 Hz), 8.24 (br, 1H), 8.16 (dd, 1H, J= 2, 5 Hz), 7.29 (t, 1H, J= 4 Hz), 7.09 (dd, 1H, J= 5, 8 Hz), 6.77 (d, 1H, J= 8 Hz), 6.55 (m, 3H), 5.96 (s, 2H), 4.59 (d, 2H, J= 6 Hz), 4.52 (s, 2H).

Example 2

15 (±)-2-[4-({[2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid of Formula (5.5.2):

(5.5.2)

The compound of Formula (5.5.2) was prepared in a manner analogous to that described in

20 Example 1, substituting (±)-2-[4-({[2-(benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid *tert*-butyl ester for the corresponding [4-({[2-(benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-acetic acid methyl ester material.

mp= 136.4-138.0 °C.

25 ¹H NMR (CDCl₃): δ 8.59 (dd, 1H, J= 2, 8 Hz), 8.30 (t, 1H, J= 6 Hz), 8.21 (dd, 1H, J= 2, 5 Hz), 7.30 (t, 1, J= 8 Hz), 7.12 (dd, 1H, J= 5, 8 Hz), 6.81 (d, 1H, J= 8 Hz), 6.60 (s, 2H), 4.74 (q, 1H, J= 7 Hz), 4.63 (d, 2H, J= 6 Hz), 1.63 (d, 3H, J= 7 Hz).

Example 3

(±)-2-[4-({[2-(Benzo[2,1,3]oxadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluorophenoxy]-propionic acid of Formula (5.5.3):

5

(5.5.3)

(±)-2-[4-({[2-(Benzo[2,1,3]oxadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluorophenoxy]-propionic acid *tert*-butyl ester (0.17 g, 0.33 mmol) was stirred in formic acid (5 mL) at room temperature 2 hours. Formic acid was removed *in vacuo* and the product stored over night under high vacuum to afford a white solid (0.12 g, 80% yield).

10 ¹H NMR (CDCl₃): δ 8.36 (dd, 1H, J= 2, 7 Hz), 8.09(dd, 1H, J= 2, 5 Hz), 8.03 (br, 1H), 7.75 (d, 1H, J= 9 Hz), 7.42 (s, 1H), 7.13 (m, 2H), 6.50 (m, 2H), 4.54 (q, 1H, J= 7 Hz), 4.49 (d, 1H, J= 6 Hz), 1.46 (d, 3H, J= 7 Hz).

MS (m/z): 452 (M⁺, 100).

15 **Example 4**

(±)-2-[3-Fluoro-4-({[2-(4-fluorophenoxy)-pyridine-3-carbonyl]-amino}-methyl)-phenoxy]-propionic acid of Formula (5.5.4):

(5.5.4)

20 The compound of Formula (5.5.4) was prepared in a manner analogous to that described in Example 3, substituting (±)-2-[3-fluoro-4-({[2-(4-fluorophenoxy)-pyridine-3-carbonyl]-amino}-methyl)-phenoxy]-propionic acid *tert*-butyl ester for the corresponding (±)-2-[4-({[2-(benzo[2,1,3]oxadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluorophenoxy]-propionic acid *tert*-butyl ester material.

20

(5.5.16)

The compound of Formula (5.5.16) was prepared in a manner analogous to that described in Example 14, substituting (R)-2-[4-(((2-(benzo[2,1,3]thiadiazol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl)-3-fluoro-phenoxy]-propionic acid for the corresponding (R)-2-[4-(((2-

- 242 -

(benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl)-3-fluoro-phenoxy]-propionic acid material.

¹H NMR (CDCl₃): δ 8.63 (dd, 1H, J= 2, 7 Hz), 8.19 (dd, 1H, J= 2, 5 Hz), 7.87 (t, 1H, J= 9. Hz), 7.52 (d, 1H, J= 2 Hz), 7.33 (s, 1H), 7.25 (t, 1H, J=5 Hz), 6.63 (m, 2H), 6.26 (br, 1H), 5.47 (br, 1H), 4.64 (d, 2H, J= 6 Hz), 4.57 (q, 1H, J= 7 Hz), 1.54 (d, 3H, J= 7 Hz).

MS (m/z): 468 (M⁺+1, 100).

Example 17

(R)-N-[4-(1-Carbamoyl-ethoxy)-2-fluoro-benzyl]-2-(3-cyano-phenoxy)-nicotinamide of Formula (5.5.17):

(5.5.17)

The compound of Formula (5.5.17) was prepared in a manner analogous to that described in Example 14, substituting (R)-2-[3-fluoro-4-([2-(3-cyano-phenoxy)-pyridine-3-carbonyl]-amino)-methyl]-phenoxy]-propionic acid for the corresponding (R)-2-[4-([2-(benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl)-3-fluoro-phenoxy]-propionic acid material.

¹H NMR (CDCl₃): δ 8.59 (dd, 1H, J= 2, 7 Hz), 8.16 (dd, 1H, J= 2, 5 Hz), 8.03 (t, 1H, J= 9 Hz), 7.38 (m, 4H), 6.63 (m, 2H), 6.27 (br, 1H), 5.48 (br, 1H), 4.59 (m, 3H), 1.55 (d, 3H, J= 7 Hz).

MS (m/z): 435 (M⁺+1, 100).

Example 18

(R)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[4-(1-carbamoyl-ethoxy)-2-fluoro-benzyl]-5-fluoro-nicotinamide of Formula (5.5.18):

5

(5.5.18)

The compound of Formula (5.5.18) was prepared in a manner analogous to that described in Example 14, substituting (R)-2-[4-({[2-(benzo[1,3]dioxol-5-yloxy)-5-fluoro-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid for the corresponding (R)-2-[4-({[2-(benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid material.

10

¹H NMR (CDCl₃): δ 8.31 (m, 2H), 8.02 (d, 1H, J = 3 Hz), 7.32 (t, 1H, J = 8 Hz), 6.80 (d, 1H, J = 8 Hz), 6.60 (m, 3H), 6.26 (br, 1H), 6.00 (s, 2H), 5.35 (br, 1H), 4.07 (m, 3H), 1.55 (d, 3H, J = 7 Hz).

MS (m/z): 472 (M⁺+1, 100).

15

Example 19

(±)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[2-fluoro-4-[1-(1H-tetrazol-5-yl)-ethoxy]-benzyl]-nicotinamide of Formula (5.5.19):

20

(5.5.19)

A solution of (±)-2-(benzo[1,3]dioxol-5-yloxy)-N-[4-(1-cyano-ethoxy)-2-fluoro-benzyl]-nicotinamide (1.5 g, 3.5 mmol) in anhydrous toluene (5 mL) was transferred to a small

- 244 -

pressure flask. Dibutyltin oxide (0.53 g, 2.1 mmol) and trimethylsilyl azide (1.7 mL, 21 mmol) were added. The tube was sealed and placed behind a blast shield. The reaction was stirred 15 min at 55 °C, then warmed to 110 °C with stirring over night. The black reaction mix was cooled to 0-5 °C, the pressure flask opened, and the residue taken up in methanol. Solvents were removed *in vacuo* and the residue taken up in ethyl acetate. The organic solution was washed twice with saturated aqueous sodium carbonate. The aqueous phases were pooled and acidified with concentrated hydrochloric acid, and extracted twice with ethyl acetate. The pooled organic phases were dried (MgSO₄), concentrated, and loaded onto a silica gel column as a brown oil. Purification by column chromatography (5% methanol/dichloromethane) afforded product as a white solid (0.46 g, 28%).

¹H NMR (CDCl₃): 8.58 (dd, 1H, J=2 Hz, 8 Hz), 8.43 (t, 1H, J= 6 Hz), 8.21 (dd, 1H, J= 2 Hz, 5 Hz), 7.13 (m, 2H), 6.79 (d, 1H, J= 8 Hz), 6.61 (d, 1H, J= 2 Hz), 6.53 (m, 3H), 5.99 (s, 2H), 5.72 (q, 1H, J= 7 Hz), 4.57 (d, 2H, J= 5 Hz), 1.78 (d, 3H, J= 6 Hz).

MS (m/z): 479 (M⁺+1, 40).

Example 20

(R)-2-(Benzo[1,3]dioxol-5-yloxy)-N-{2-fluoro-4-[1-(5-methyl-4H-[1,2,4]triazol-3-yl)-ethoxy]-benzyl}-nicotinamide of Formula (5.5.20):

20

(5.5.20)

A solution of (R)-2-[4-({[2-(benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionimidic acid ethyl ester (0.16 g, 0.33 mmol) and acetic hydrazide (24 mg, 0.31 mmol) in *n*-butanol (20 ml) was stirred 20 h at 80 °C. The reaction was cooled to room temperature and quenched into saturated aqueous oxalic acid and extracted with ethyl acetate. The organic solution was dried (MgSO₄), and concentrated *in vacuo*. The residue was purified by column chromatography (3% methanol/dichloromethane) to afford a sticky yellow solid (12 mg). The residue was further purified by preparatory thin layer chromatography (10% methanol/dichloromethane) to afford 7 mg of the desired compound (4%yield).

- 245 -

¹H NMR (CDCl₃): 8.52 (d, 1H, J= 7.8 Hz), 8.42 (s, 1H), 8.21 (dd, 1H, J= 5.0, 1.9 Hz), 7.19 (t, 1H, J= 8.3 Hz), 7.11 (m, 1H), 6.77 (m, 4H), 6.00 (s, 2H), 5.48 (d, 2H, J= 6.6 Hz), 4.60 (s, 2H), 2.45 (s, 3H), 1.75 (d, 3H, J= 6.7 Hz).

5 Example 21

(R)-2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-[1-(5-methyl-4H-[1,2,4]triazol-3-yl)-ethoxy]-benzyl]-nicotinamide of Formula (5.5.21):

(5.5.21)

- 10 A solution of (R)-2-(benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(1-thiocarbamoyl-ethoxy)-benzyl]-nicotinamide (0.1 g, 0.21 mmol) in pyridine (5 ml) was warmed with stirring to 70 °C. Anhyd. hydrazine (1.5 ml, 50 mmol) was added with stirring via a syringe. The reaction mixture was stirred at 70 °C 5 min, the cooled to room temperature. The solvent was removed *in vacuo*, and the residue to stored under house vacuum 1 h. The residue was
- 15 subsequently taken up in fresh pyridine (5 ml). To this solution was added acetyl chloride (0.057 ml, 0.8 mmol) at room temperature, and the reaction mixture was stirred 2 h. The pyridine was removed *in vacuo*, and replaced with *N,N*-dimethylformamide (5 ml) and the resulting solution was stirred at 130°C 4 h. The reaction was cooled to room temperature, quenched into water (50 ml) and extracted with diethyl ether. The pooled extracts were dried
- 20 (MgSO₄), filtered and concentrated to near-dryness, then loaded onto a silica gel column and purified by column chromatography (gradient 1% methanol/dichloromethane changing to 5% methanol/dichloromethane) to afford a white solid (7.6 mg, 7% yield).

MS (m/z): 509 (M⁺, 20).

[α]_D = +24° (CHCl₃).

Example 22

(±)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[2-fluoro-4-[1-(1H-tetrazol-5-yl)-ethoxy]-benzyl]-nicotinamide of Formula (5.5.22):

5

(5.5.22)

A solution of (±)-2-(benzo[1,3]dioxol-5-yloxy)-N-[4-(1-cyano-ethoxy)-2-fluoro-benzyl]-nicotinamide (1.5 g, 3.5 mmol) in anhydrous toluene (5 mL) was transferred to a small pressure flask. Dibutyltin oxide (0.53 g, 2.1 mmol) and trimethylsilyl azide (1.7 mL, 21 mmol) were added. The tube was sealed and placed behind a blast shield. The reaction was stirred 10 15 min at 55 °C, then warmed to 110 °C with stirring over night. The black reaction mix was cooled to 0-5 °C, the pressure flask opened, and the residue taken up in methanol. Solvents were removed *in vacuo* and the residue taken up in ethyl acetate. The organic solution was washed twice with saturated aqueous sodium carbonate. The aqueous phases were pooled and acidified with concentrated hydrochloric acid, and extracted twice with ethyl acetate. The 15 pooled organic phases were dried (MgSO₄), concentrated, and loaded onto a silica gel column as a brown oil: Purification by column chromatography (5% methanol/dichloromethane) afforded product as a white solid (0.46 g, 28%).

¹H NMR (CDCl₃): 8.58 (dd, 1H, J=2 Hz, 8 Hz), 8.43 (t, 1H, J= 6 Hz), 8.21 (dd, 1H, J= 2 Hz, 5 Hz), 7.13 (m, 2H), 6.79 (d, 1H, J= 8 Hz), 6.61 (d, 1H, J= 2 Hz), 6.53 (m, 3H), 5.99 (s, 2H), 20 5.72 (q, 1H, J= 7 Hz), 4.57 (d, 2H, J= 5 Hz), 1.78 (d, 3H, J= 6 Hz).

MS (m/z): 479 (M⁺+1, 40).

Example 23

(R)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[2-fluoro-4-(2-hydroxy-1,2-dimethyl-propoxy)-benzyl]-nicotinamide of Formula (5.5.23):

5

(5.5.23)

To a stirred solution of (R)-2-[4-({[2-(benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid methyl ester (0.10 g, 0.213 mmol) in tetrahydrofuran (5 ml) at -10°C , methyl magnesium chloride (3.0 ml, 1.07 mmol) was added, and stirred at -10°C 15 min. The solution was allowed to warm to room temperature and stirred a further 16 h. The reaction was quenched into water and extracted with ethyl acetate. The pooled organics were dried (MgSO_4), filtered and concentrated to an opaque white oil. The residue was purified by column chromatography (1:1 ethyl acetate/hexane), affording 40 mg white powder (40% yield).

^1H NMR (CDCl_3): 8.60 (d, 1H, $J = 7.4$ Hz), 8.25 (s, 1H), 8.21 (d, 1H, $J = 4.6$ Hz), 7.31 (t, 1H, $J = 8.3$ Hz), 7.12 (dd, 1H, $J = 5.0, 7.9$ Hz), 6.83 (d, 1H, $J = 8.3$ Hz), 6.67 (m, 4H), 6.00 (s, 2H), 4.64 (d, 2H, $J = 4.6$ Hz), 4.12 (q, 1H, $J = 6.2$ Hz), 1.25 (s, 6H), 1.22 (d, 3H, $J = 6.2$ Hz).

MS (m/z): 467 (M^+ , 100).

Example 24

(R)-2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(2-hydroxy-1,2-dimethyl-propoxy)-benzyl]-nicotinamide of Formula (5.5.24):

5

(5.5.24)

Prepared in a manner analogous to Example 23, substituting (R)-2-[4-([2-(benzo[1,3]dioxol-5-yloxy)-5-fluoro-pyridine-3-carbonyl]-amino)-methyl]-3-fluoro-phenoxy]-propionic acid methyl ester.

¹H NMR (CDCl₃): 8.33 (dd, 1H, J= 8.3, 3.3 Hz), 8.30 (s, 1H), 8.03 (d, 1H, J= 2.9 Hz), 7.30 (t, 1H, J= 8.7 Hz), 6.81 (d, 1H, J= 8.3 Hz), 6.62 (m, 4H), 6.01 (s, 2H), 4.63 (d, 2H, J= 5.8 Hz), 4.12 (q, 1H, J= 6.2 Hz), 1.25 (s, 6H), 1.22 (d, 3H, J= 6.2 Hz).

10

MS (m/z): 487 (M⁺ 100).

Example 25

(S)-3-[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluoro-phenoxy]-2-methyl-propionic acid of Formula (5.5.25):

15

(5.5.25)

2-(Benzo[1,3]-dioxol-5-yloxy)-nicotinic acid (0.168 g, 0.65 mmol), (S)-3-(4-aminomethyl-3-fluoro-phenoxy)-2-methyl-propionic acid methyl ester hydrochloride (0.18 g, 0.65 mmol), 1-hydroxybenzotriazole hydrate (0.097 g, 0.72 mmol), 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (0.138 g, 0.72 mmol) and triethylamine were dissolved in N,

20

- 249 -

N-dimethylformamide (6 mL) and stirred at room temperature over night. The reaction was diluted in ethyl acetate and washed successively with dilute aqueous hydrochloric acid, dilute aqueous sodium hydroxide, and brine, and dried (Na₂SO₄). The product was purified by flash column chromatography (20% ethyl acetate/hexane). The residue was taken up in tetrahydrofuran (10 mL) and methanol (2 mL) and aqueous lithium hydroxide (2 mL, 1 M, 2 mmol). The reaction was stirred at room temperature 1 h. The solvents were stripped *in vacuo* and the residue partitioned between dilute aqueous hydrochloric acid and ethyl acetate. The aqueous was extracted with 2 aliquots ethyl acetate and the pooled organics were washed with brine, dried over sodium sulfate and concentrated *in vacuo* to afford a white solid (0.12g, 39% yield).

¹H NMR (CDCl₃): 8.60 (d, 1H, J= 8 Hz), 8.20 (m, 2H), 7.30 (t, 1H, J=8 Hz), 7.11 (m, 1H), 6.81 (d, 1H, J= 8 Hz), 6.62 (m, 3H), 6.00 (s, 2H), 4.63 (d, 2H, J= 6 Hz), 4.13 (dd, 1H, J= 7, 9 Hz), 3.93 (dd, 1H, J= 6, 9 Hz), 3.70 (s, 3H), 2.91 (m, 1H), 1.26 (d, 3H, J= 7 Hz).

MS (m/z): 469 (MH⁺, 100).

EXAMPLE 26

2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(pyridin-2-ylmethoxy)-benzyl]-nicotinamide of Formula (5.5.26):

(5.5.26)

To a stirred solution of 100 mg (0.25 mmol.) 2-(benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-(2-fluoro-4-hydroxy-benzyl)-nicotinamide [Prepared analogous to preparation 35 by substituting 2-chloro-5-fluoro-nicotinic acid (EP 0634413 A1)], 10 mL DMF and 175 mg (1.25 mmol.) potassium carbonate was added a solution of DMF(5 mL) containing 82 mg (0.5 mmol.) 2-chloromethyl-pyridine hydrochloride (Aldrich) and 1 equivalent of triethyl amine. The resulting mixture was stirred for 3 days at room temperature. Reaction mixture was poured into ice water (200 mL) and the resulting solid was filtered, washed with cold water and dried *in vacuo* to afford desired product.

MS (m/z): 492 (M⁺, 100).

- 250 -

¹H-NMR (CDCl₃): 8.58 (d, 1H, J= 5Hz), 8.32 (dd, 1 H, J=4,9Hz), 8.02 (d, 1H, J= 3 Hz), 7.71 (dt, 1H, J= 2,10Hz), 7.47 (d, 1H, J= 2 Hz), 7.26 (m, 1H), 6.80 (d, 1H, J=8Hz), 6.71 (m, 3H), 6.62 (d, 1H, J=3Hz), 6.56 (dd, 1H, J= 2,8Hz), 6.00 (s, 2H), 5.2 (s, 2H), 4.63 (d, 2H, J=6Hz).

5 EXAMPLE 27

2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(pyridin-4-ylmethoxy)-benzyl]-nicotinamide of Formula (5.5.27):

(5.5.27)

- 10 Prepared analogous to Example 26 by substituting 4-chloromethyl-pyridine hydrochloride (Aldrich).

MS (m/z): 492 (M⁺, 100).

¹H-NMR (CDCl₃): 8.38 (m, 2 H), 8.02 (d, 1H, J= 3 Hz), 7.74 (m, 1H), 7.26 (m, 1H), 6.80 (d, 1H, J=8Hz), 6.71 (m, 3H), 6.62 (d, 1H, J=3Hz), 6.56 (dd, 1H, J= 2,8Hz), 6.00 (s, 2H), 5.2 (s, 2H), 4.63 (d, 2H, J=6Hz).

15

EXAMPLE 28

2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(pyridin-3-ylmethoxy)-benzyl]-nicotinamide of Formula (5.5.28):

(5.5.28)

20

Prepared analogous to Example 26 by substituting 4-chloromethyl-pyridine hydrochloride (Aldrich).

- 251 -

MS (m/z): 492 (M^+ , 100).

$^1\text{H-NMR}$ (CDCl_3): 8.81 (s, 1H), 8.64 (d, 1H, $J = 5\text{Hz}$), 8.35 (m, 2 H), 8.02 (d, 1H, $J = 3\text{ Hz}$), 7.71 (dt, 1H, $J = 2,10\text{Hz}$), 7.47 (d, 1H, $J = 2\text{ Hz}$), 7.26 (m, 1H), 6.80 (d, 1H, $J=8\text{Hz}$), 6.71 (m, 3H), 6.62 (d, 1H, $J=3\text{Hz}$), 6.56 (dd, 1H, $J = 2,8\text{Hz}$), 6.00 (s, 2H), 5.2 (s, 2H), 4.63 (d, 2H, $J=6\text{Hz}$).

5

- 252 -

WHAT IS CLAIMED IS:

1. A compound of Formula (1.0.0):

5

(1.0.0)

— wherein —

-j is 0 or 1; provided that when j is 0, n must be 2;

-k is 0 or 1

-m is 1, 2, or 3;

10 -n is 1 or 2;

-W¹ and W² are independently —O—; —S(=O)_t—, where t is 0, 1, or 2; or
 -N(R³)— where R³ has the same meaning as defined below;

-Y is =C(R^{1a})—, where R^{1a} has the same meaning as defined below; or
 -[N⇒(O)_k]— where k is 0 or 1;

15

— where —

-R^{1a} is a member selected from the group consisting of -H; -F; -Cl; -CN; -NO₂;
 -(C₁-C₄) alkyl; -(C₂-C₄) alkynyl; fluorinated-(C₁-C₃) alkyl; fluorinated-(C₁-C₃) alkoxy;
 -OR^{1b}; and -C(=O)NR^{22a}R^{22b};

— where —

20 -R^{22a} and R^{22b} are each independently -H; -CH₃; -CH₂CH₃; -CH₂CH₂CH₃;
 -CH₂(CH₃)₂; -CH₂CH₂CH₂CH₃; -CH(CH₃)CH₂CH₃; -CH₂CH(CH₃)₂; -C(CH₃)₃; cyclopropyl;
 cyclobutyl; or cyclopentyl;

-R^A and R^B are each a member independently selected from the group consisting
 of -H; -F; -CF₃; -(C₁-C₄) alkyl; -(C₃-C₇) cycloalkyl; phenyl; and benzyl; wherein said
 25 cycloalkyl, phenyl, and benzyl moieties are each independently substituted with 0 to 3
 substituents R¹⁰;

- 253 -

— where —

- 5 $-R^{10}$ is a member selected from the group consisting of phenyl; pyridyl; $-F$; $-Cl$; $-CF_3$; oxo ($=O$); $-OR^{16}$; $-NO_2$; $-CN$; $-C(=O)OR^{16}$; $-O-C(=O)R^{16}$; $-C(=O)NR^{16}R^{17}$; $-O-C(=O)NR^{16}R^{17}$; $-NR^{16}R^{17}$; $-NR^{16}C(=O)R^{17}$; $-NR^{16}C(=O)OR^{17}$; $-NR^{16}S(=O)_2R^{17}$; and $-S(=O)_2NR^{16}R^{17}$; where said phenyl or pyridyl is substituted by 0 to 3 R^{11} ;

— where —

- $-R^{11}$ is $-F$; $-Cl$; $-CF_3$; $-CN$; $-NO_2$; $-OH$; $-(C_1-C_3)$ alkoxy; $-(C_1-C_3)$ alkyl; or $-NR^{16}R^{17}$;

— and —

- 10 $-R^{16}$ and R^{17} are each a member independently selected from the group consisting of $-H$; $-(C_1-C_4)$ alkyl; $-(C_2-C_4)$ alkenyl; $-(C_3-C_6)$ cycloalkyl; phenyl; benzyl; and pyridyl; wherein said alkyl, alkenyl, cycloalkyl, phenyl, benzyl, or pyridyl is substituted by 0 to 3 substituents selected from the group consisting of $-F$, $-Cl$, $-CF_3$, $-CN$, and $-(C_1-C_3)$ alkyl;

— or —

- 15 $-R^A$ and R^B are taken together, but only in the case where m is 1, to form a spiro moiety of Formula (1.2.0):

(1.2.0)

— where —

- 20 $-r$ and s are independently 0 to 4 provided that the sum of $r + s$ is at least 1 but not greater than 5;

— and —

- 25 $-X^A$ is selected from $-CH_2-$, $-CH(R^{11})-$, or $C(R^{11})_2-$, where each R^{11} is selected independently of the other and each has the same meaning as defined above; $-NR^{15}-$, where R^{15} has the same meaning as defined below; $-O-$; and $-S(=O)_t-$, where t is 0, 1, or 2;

— and —

- 254 -

said spiro moiety of partial Formula (1.2.0) is substituted as to any one or more carbon atoms thereof, other than that defining X^A , by 0 to 3 substituents R^{14} , where R^{14} has the same meaning as defined below; as to a nitrogen atom thereof by 0 or 1 substituent R^{15} , where R^{15} has the same meaning as defined below; and as to a sulfur atom thereof by 0 or 2 oxygen atoms;

$-R^C$ and R^D have the same meaning as defined above for R^A and R^B except that one of them must be $-H$, and they are selected independently of each other and of R^A and R^B ;

$-R^1$ and R^2 may individually or together appear on any ring or rings comprising a meaning of the moiety J^2 as defined below; and R^1 and R^2 are each a member independently selected from the group consisting of $-H$; $-F$; $-Cl$; $-CN$; $-NO_2$; $-(C_1-C_4)$ alkyl; $-(C_2-C_4)$ alkynyl; fluorinated- $-(C_1-C_3)$ alkyl; $-OR^{16}$; and $-C(=O)NR^{22a}R^{22b}$; where R^{16} , R^{22a} , and R^{22b} have the same meanings as defined above;

$-R^3$ is $-H$; $-(C_1-C_3)$ alkyl; phenyl; benzyl; or $-OR^{16}$, where R^{16} has the same meaning as defined above;

$-R^4$, R^5 and R^6 may individually or together appear on any ring or rings comprising a meaning of the moiety J^1 as defined below; and R^4 , R^5 and R^6 are each a member independently selected from the group consisting of

— the following: —

$-(a)$ $-H$; $-F$; $-Cl$; $-(C_2-C_4)$ alkynyl; $-R^{16}$; $-OR^{16}$; $-S(=O)_pR^{16}$; $-C(=O)R^{16}$; $-C(=O)OR^{16}$; $-OC(=O)R^{16}$; $-CN$; $-NO_2$; $-C(=O)NR^{16}R^{17}$; $-OC(=O)NR^{16}R^{17}$; $-NR^{22a}C(=O)NR^{16}R^{17}$; $-NR^{22a}C(=NR^{12})NR^{16}R^{17}$; $-NR^{22a}C(=NCN)NR^{16}R^{17}$; $-NR^{22a}C(=N-NO_2)NR^{16}R^{17}$; $-C(=NR^{22a})NR^{16}R^{17}$; $-CH_2C(=NR^{22a})NR^{16}R^{17}$; $-OC(=NR^{22a})NR^{16}R^{17}$; $-OC(=N-NO_2)NR^{16}R^{17}$; $-NR^{16}R^{17}$; $-CH_2NR^{16}R^{17}$; $-NR^{22a}C(=O)R^{16}$; $-NR^{22a}C(=O)OR^{16}$; $=NOR^{16}$; $-NR^{22a}S(=O)_pR^{17}$; $-S(=O)_pNR^{16}R^{17}$; and $-CH_2C(=NR^{22a})NR^{16}R^{17}$;

— where —

$-p$ is 0, 1, or 2; and R^{22a} , R^{16} , and R^{17} have the same meanings as defined above;

$-(b)$ $-(C_1-C_4)$ alkyl; and $-(C_1-C_4)$ alkoxy in the case where one or more of R^4 , R^5 , or R^6 has the meaning of $-OR^{16}$ under (a) above and R^{16} is defined as $-(C_1-C_4)$ alkyl; wherein said alkyl and alkoxy are each independently substituted with 0 to 3 substituents $-F$ or $-Cl$; or 0 or 1 substituent (C_1-C_2) alkoxycarbonyl-; (C_1-C_2) alkylcarbonyl-; or (C_1-C_2) alkylcarbonyloxy-;

- 255 -

— and —

- 5 -(c) an aryl or heterocyclyl moiety selected from the group consisting of phenyl; benzyl; furanyl; tetrahydrofuranyl; oxetanyl; thienyl; tetrahydrothienyl; pyrrolyl; pyrrolidinyl; oxazolyl; oxazolidinyl; isoxazolyl; isoxazolidinyl; thiazolyl; thiazolidinyl; isothiazolyl; isothiazolidinyl; pyrazolyl; pyrazolidinyl; oxadiazolyl; thiadiazolyl; imidazolyl; imidazolidinyl; pyridinyl; pyrazinyl; pyrimidinyl; pyridazinyl; piperidinyl; piperazinyl; triazolyl; triazinyl; tetrazolyl; pyranyl; azetidyl; morpholinyl, parathiazinyl; indolyl; indolinyl; benzo[b]furanyl; 2,3-dihydrobenzofuranyl; 2-*H*-chromenyl; chromanyl; benzothienyl; 1-*H*-indazolyl; benzimidazolyl; benzoxazolyl; benzisoxazolyl; benzthiazolyl; quinolinyl; isoquinolinyl; phthalazinyl; quinazolinyl; quinoxalyl; and purinyl; wherein said aryl and heterocyclyl moieties are each independently substituted with 0 to 2 substituents R¹⁴

— where —

- 15 -R¹⁴ is a member selected from the group consisting of -(C₁-C₄) alkyl; -(C₃-C₇) cycloalkyl; phenyl; benzyl; pyridyl; and quinolinyl; where said alkyl, cycloalkyl, phenyl, benzyl, pyridyl, or quinolinyl is substituted by 0, 1, or 2 substituents -F, -Cl, -CH₃, -OR¹⁶, -NO₂, -CN, or -NR¹⁶R¹⁷; and said R¹⁴ group further consists of -F; -Cl; -CF₃; oxo (=O); -OR¹⁶; -NO₂; -CN; -C(=O)OR¹⁶; -O-C(=O)R¹⁶; -C(=O)NR¹⁶R¹⁷; -O-C(=O)NR¹⁶R¹⁷; -NR¹⁶R¹⁷; -NR¹⁶C(=O)R¹⁷; -NR¹⁶C(=O)OR¹⁷; -NR¹⁶S(=O)₂R¹⁷; or -S(=O)₂NR¹⁶R¹⁷; where R¹⁶ and R¹⁷ have the same meanings as defined above;

20

— and further where —

- 25 -R¹⁵ is a member independently selected from the group consisting of -H; -NR¹⁶R¹⁷; -C(=O)R¹⁶; -OR¹⁶; -(C₁-C₄) alkyl-OR¹⁶; -C(=O)OR¹⁶; -(C₁-C₂) alkyl-C(=O)OR¹⁶; -C(=O)NR¹⁶R¹⁷; -(C₁-C₄) alkyl; -(C₂-C₄) alkenyl; -(CH₂)_u-(C₃-C₇) cycloalkyl where u is 0, 1 or 2; phenyl; benzyl; pyridyl; and quinolinyl; wherein said alkyl, alkenyl, alkoxy, cycloalkyl, phenyl, benzyl, pyridyl or quinolinyl is substituted with 0 to 3 substituents R¹²; where R¹⁶ and R¹⁷ have the same meanings as defined above; and

— where —

- 30 ---R¹² is a member independently selected from the group consisting of -F; -Cl; -CO₂R¹⁸; -OR¹⁶; -CN; -C(=O)NR¹⁸R¹⁹; -NR¹⁸R¹⁹; -NR¹⁸C(=O)R¹⁹; -NR¹⁸C(=O)OR¹⁹; -NR¹⁸S(=O)_pR¹⁹; -S(=O)_pNR¹⁸R¹⁹, where p is 1 or 2; -(C₁-C₄) alkyl; and -(C₁-C₄) alkoxy in the case where R¹² has the meaning of -OR¹⁶ above and R¹⁶ is defined as -(C₁-C₄) alkyl; wherein said alkyl and alkoxy are each independently substituted with 0 to 3 substituents independently selected from -F; -Cl; -(C₁-C₂) alkoxycarbonyl; -(C₁-C₂) alkylcarbonyl; and -(C₁-C₂) alkylcarbonyloxy; where R¹⁸ has the same meaning as defined above; and

- 256 -

— where —

— R^{18} and R^{19} are independently selected from the group consisting of $-H$;
 $-(C_1-C_4)$ alkyl; and phenyl; where said alkyl or phenyl is substituted by 0-3 of $-F$; or $-Cl$;

— or in the case where J^1 is phenyl —

- 5 $-(d)$ R^5 and R^6 are taken together to form a moiety which is a member selected from the group consisting of partial Formulas (1.3.1) through (1.3.15):

— wherein —

- 15 $-R^{20}$ and R^{21} are each a member independently selected from the group consisting of
 $-H$; $-F$; $-Cl$; $-CH_3$; $-CH_2F$; $-CHF_2$; $-CF_3$; $-OCH_3$; and $-OCF_3$;

$-R^{23}$ and R^{24} are each independently $-H$; $-CH_3$; $-OCH_3$; $-CH_2CH_3$; $-OCH_2CH_3$;
 $-CH_2CH_2CH_3$; $-CH_2(CH_3)_2$; $-CH_2CH_2CH_2CH_3$; $-CH(CH_3)CH_2CH_3$; $-CH_2CH(CH_3)_2$; $-C(CH_3)_3$;
 or absent, in which case the dashed line $---$ represents a double bond;

- 20 J^1 is a moiety comprising a saturated or unsaturated carbon ring system that is
 a 3- to 7-membered monocyclic, or that is a 7- to 12-membered, fused polycyclic; provided
 that J^1 is not a discontinuous or restricted biaryl moiety as defined under J^2 below; and
 wherein optionally one carbon atom of said carbon ring system may be replaced by a
 heteroatom selected from N, O, and S; where optionally a second carbon atom thereof, and
 further optionally a third carbon atom thereof may be replaced by N;

25

— wherein —

- 257 -

said moiety defining J^1 is substituted on any ring or rings thereof by R^4 , R^5 and R^6 , which have the same meaning as defined above;

- J^2 is a moiety comprising a saturated or unsaturated carbon ring system that is a 3- to 7-membered monocyclic, or that is a 7- to 12-membered, fused polycyclic; provided that J^2 is not a discontinuous or restricted biaryl moiety; and wherein optionally one carbon atom of said carbon ring system may be replaced by a heteroatom selected from N, O, and S; where optionally a second carbon atom thereof, and further optionally a third carbon atom thereof may be replaced by N;

— wherein —

- said moiety defining J^2 is substituted on any ring or rings thereof by R^1 and R^2 , which have the same meaning as defined above;

-D is a member independently selected from the group consisting of

— the following —

-(a) the group consisting of partial Formulas (1.1.1) through (1.1.9):

— wherein —

- 20 --"*" Indicates the point of attachment of each partial Formula (1.1.1) through (1.1.9) to the remaining portion of Formula (1.0.0);

--q is 1, 2, or 3, provided that where q is 2 or 3, R^9 has the meaning of -H in at least one instance, or two instances, respectively;

- 258 -

--v 0 or 1;

--W³ is --O--; --N(R⁹)--; where R⁹ has the same meaning as defined below; or
--OC(=O)--;

--R⁷ is a member independently selected from the group consisting of

5 -- the following: --

--(1) --H;

--(2) --(C₁-C₆) alkyl; --(C₂-C₆) alkenyl; or --(C₂-C₆) alkynyl; where said alkyl, alkenyl or alkynyl is substituted by 0 to 3 substituents R¹⁰, where R¹⁰ has the same meaning as defined above;

10 --(3) --(CH₂)_u-(C₃-C₇) cycloalkyl where u is 0, 1 or 2; and further where said (C₃-C₇) cycloalkyl is substituted by 0 to 3 substituents R¹⁰ where R¹⁰ has the same meaning as defined above;

-- and --

--(4) phenyl or benzyl, where said phenyl or benzyl is independently substituted by
15 0 to 3 substituents R¹⁰ where R¹⁰ has the same meaning as defined above;

--R⁸ is a member independently selected from the group consisting of

-- the following: --

--(1) phenyl; tetrazol-5-yl; 1,2,4-triazol-3-yl; 1,2,4-triazol-3-on-5-yl; 1,2,3-triazol-5-yl; imidazol-2-yl; imidazol-4-yl; imidazolidin-2-on-4-yl; 1,3,4-oxadiazolyl; 1,3,4-oxadiazol-2-on-5-yl; 1,2,4-oxadiazol-3-yl; 1,2,4-oxadiazol-5-on-3-yl; 1,2,4-oxadiazol-5-yl; 1,2,4-oxadiazol-3-on-5-yl; 1,2,5-thiadiazolyl; 1,3,4-thiadiazolyl; morpholinyl; parathiazinyl; oxazolyl; isoxazolyl; thiazolyl; isothiazolyl; pyrrolyl; pyrazolyl; succinimidyl; glutarimidyl; pyrrolidonyl; 2-piperidonyl; 2-pyridonyl; 4-pyridonyl; pyridazin-3-onyl; pyridyl; pyrimidinyl; pyrazinyl; pyridazinyl;

25 -- and --

--(2) indolyl; indolinyl; isoindolinyl; benzo[b]furanyl; 2,3-dihydrobenzofuranyl; 1,3-dihydroisobenzofuranyl; 2H-1-benzopyranyl; 2-H-chromenyl; chromanyl; benzothienyl; 1H-indazolyl; benzimidazolyl; benzoxazolyl; benzisoxazolyl; benzothiazolyl; benzotriazolyl; benzotriazinyl; phthalazinyl; 1,8-naphthyridinyl; quinolinyl; isoquinolinyl; quinazolinyl; quinoxalinyl; pyrazolo[3,4-d]pyrimidinyl; pyrimido[4,5-d]pyrimidinyl; imidazo[1,2-a]pyridinyl; pyridopyridinyl; pteridinyl; and 1H-purinyl;

30

- 259 -

— where —

any moiety recited in (1) or (2) above is optionally substituted with respect to (i) any one or more carbon atoms thereof optionally by a substituent R^{14} where R^{14} has the same meaning as defined above; (ii) any one or more nitrogen atoms thereof that is not a point of attachment of said moiety, optionally by a substituent R^{15} where R^{15} has the same meaning as defined above, and all tautomer forms thereof; and (iii) any sulfur atom thereof that is not a point of attachment of said moiety, by 0, 1, or 2 oxygen atoms;

5 $-R^9$ is a member selected from the group consisting of $-H$; $-(C_1-C_4)$ alkyl; $-(C_3-C_7)$ cycloalkyl; phenyl; benzyl; pyridyl; $-C(=O)OR^{16}$; $-C(=O)R^{16}$; $-OR^{16}$; $-(C_1-C_2)$ alkyl-
10 OR^{16} ; and $-(C_1-C_2)$ alkyl- $C(=O)OR^{16}$; where R^{16} has the same meaning as defined above;

— and D is further selected from —

15 $-(b)$ a moiety comprising a member selected from the group consisting of $-O-P(=O)(OH)_2$ (phosphoric); $-PH(=O)OH$ (phosphinic); $-P(=O)(OH)_2$ (phosphonic); $-[P(=O)(OH)-O(C_1-C_4)$ alkyl] (alkylphosphono); $-P(=O)(OH)-O(C_1-C_4)$ alkyl (alkylphosphinyl); $-P(=O)(OH)NH_2$ (phosphoramido); $-P(=O)(OH)NH(C_1-C_4)$ alkyl and $-P(=O)(OH)NHR^{25}$ (substituted phosphoramido); $-O-S(=O)_2OH$ (sulfuric); $-S(=O)_2OH$ (sulfonic); $-S(=O)_2NHR^{26}$ or $-NHS(=O)_2R^{26}$ (sulfonamido) where R^{26} is $-CH_3$, $-CF_3$, or o -toluyl; and acylsulfonamido selected from the group consisting of $-C(=O)NHS(=O)_2R^{25}$; $-C(=O)NHS(=O)_2NH_2$; $-C(=O)NHS(=O)_2(C_1-C_4)$ alkyl; $-C(=O)NHS(=O)_2NH(C_1-C_4)$ alkyl;
20 $-C(=O)NHS(=O)_2N[(C_1-C_4)$ alkyl] $_2$; $-S(=O)_2NHC(=O)(C_1-C_4)$ alkyl; $-S(=O)_2NHC(=O)NH_2$; $-S(=O)_2NHC(=O)NH(C_1-C_4)$ alkyl; $-S(=O)_2NHC(=O)N[(C_1-C_4)$ alkyl] $_2$; $-S(=O)_2NHC(=O)R^{25}$; $-S(=O)_2NHCN$; $-S(=O)_2NHC(=S)NH_2$; $-S(=O)_2NHC(=S)NH(C_1-C_4)$ alkyl; $-S(=O)_2NHC(=S)N[(C_1-C_4)$ alkyl] $_2$; and $-S(=O)_2NHS(=O)_2R^{25}$;

— where —

25 $-R^{25}$ is $-H$; $-(C_1-C_4)$ alkyl; phenyl; or $-OR^{18}$, where R^{18} has the same meaning as defined above;

— or —

a pharmaceutically acceptable salt thereof.

30 2. A compound according to Claim 1 wherein the right-hand terminus thereof, where m is 1, is represented by partial Formula (1.0.5):

- 260 -

(1.0.5)

where "*" is a symbol representing the point of attachment of the moiety of partial Formula (1.0.5) to the remaining portion of a compound of Formula (1.0.0); where R^A and R^B are both -H, or one is -H and the other is -CH₃, or both are -CH₃, or both are taken together to form spiro-cyclopropyl or spiro-cyclobutyl; R^1 is -H, -OCH₃, or 2'-F; R^2 is -H; and the moieties J^2 and D are selected such that, said moiety of partial Formula (1.0.5) is a member selected from the group consisting of partial Formulas (1.5.1) through (1.5.54):

(1.5.1)

(1.5.2)

(1.5.3)

(1.5.4)

(1.5.5)

(1.5.6)

(1.5.7)

(1.5.8)

(1.5.9)

(1.5.10)

(1.5.11)

(1.5.12)

- 261 -

(1.5.13)

(1.5.14)

(1.5.15)

(1.5.16)

(1.5.17)

(1.5.18)

(1.5.19)

(1.5.20)

(1.5.21)

(1.5.22)

(1.5.23)

(1.5.24)

(1.5.25)

(1.5.26)

(1.5.27)

(1.5.28)

(1.5.29)

(1.5.30)

- 262 -

(1.5.31)

(2.5.28)

(2.5.29)

(2.5.30)

(2.5.31)

(2.5.32)

(2.5.33)

(2.5.34)

(2.5.35)

(2.5.36)

(2.5.37)

(2.5.38)

(2.5.39)

(2.5.40)

- 268 -

5. A compound according to Claim 1 wherein R^5 and R^6 as taken together to form a moiety which is a member selected from the group consisting of partial Formulas (1.3.1), (1.3.11), (1.3.12), and (1.3.15):

where R^{20} , R^{21} , R^{23} , and R^{24} have the same meaning as defined in Claim 1.

10 6. A compound according to Claim 8 wherein R^5 and R^6 are taken together to form a moiety which is a member selected from the group consisting of partial Formulas (2.1.1), (2.1.4) through (2.1.6), (2.1.11), and (2.1.16) through (2.1.20):

- 269 -

(2.1.16)

(2.1.17)

(2.1.18)

(2.1.19)

(2.1.20)

wherein the dashed line ---- in partial Formulas (2.1.18), (2.1.19), and (2.1.20) represents a double bond where no oxygen atom is attached to the corresponding nitrogen atom, and represents a single bond where an oxygen atom is attached to said corresponding nitrogen atom.

5

7. A compound according to Claim 1 wherein said compound is a member selected from the group consisting of the following:

[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluorophenoxy]-acetic acid of Formula (5.5.1);

10 (±)-2-[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluorophenoxy]-propionic acid of Formula (5.5.2);

(±)-2-[4-([2-(Benzo[2,1,3]oxadiazol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluorophenoxy]-propionic acid of Formula (5.5.3);

15 (±)-2-[3-Fluoro-4-([2-(4-fluorophenoxy)-pyridine-3-carbonyl]-amino)-methyl]-phenoxy]-propionic acid of Formula (5.5.4);

(±)-2-[3-Fluoro-4-([2-(3-cyano-phenoxy)-pyridine-3-carbonyl]-amino)-methyl]-phenoxy]-propionic acid of Formula (5.5.5);

(±)-2-[4-([2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-pyridine-3-carbonyl]-amino)-methyl]-3-fluorophenoxy]-propionic acid of Formula (5.5.6);

20 (±)-2-[4-([2-(Benzo[2,1,3]thiadiazol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluorophenoxy]-propionic acid of Formula (5.5.7);

(R)-2-[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluorophenoxy]-propionic acid of Formula (5.5.8);

25 (S)-2-[4-([2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino)-methyl]-3-fluorophenoxy]-propionic acid of Formula (5.5.9);

- 270 -

- (R)-2-[4-({[2-(Benzo[2,1,3]oxadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid of Formula (5.5.10);
- (R)-2-[3-Fluoro-4-({[2-(3-cyano-phenoxy)-pyridine-3-carbonyl]-amino}-methyl)-phenoxy]-propionic acid of Formula (5.5.11);
- 5 (R)-2-[4-({[2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid of Formula (5.5.12);
- (R)-2-[4-({[2-(Benzo[2,1,3]thiadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluoro-phenoxy]-propionic acid of Formula (5.5.13);
- (R)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[4-(1-carbamoyl-ethoxy)-2-fluoro-benzyl]-
10 nicotinamide of Formula (5.5.14);
- (R)-2-(Benzo[2,1,3]oxadiazol-5-yloxy)-N-[4-(1-carbamoyl-ethoxy)-2-fluoro-benzyl]-nicotinamide of Formula (5.5.15);
- (R)-2-(Benzo[2,1,3]thiadiazol-5-yloxy)-N-[4-(1-carbamoyl-ethoxy)-2-fluoro-benzyl]-nicotinamide of Formula (5.5.16);
- 15 (R)-N-[4-(1-Carbamoyl-ethoxy)-2-fluoro-benzyl]-2-(3-cyano-phenoxy)-nicotinamide of Formula (5.5.17);
- (R)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[4-(1-carbamoyl-ethoxy)-2-fluoro-benzyl]-5-fluoro-nicotinamide of Formula (5.5.18);
- (±)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[2-fluoro-4-[1-(1H-tetrazol-5-yl)-ethoxy]-benzyl]-
20 nicotinamide of Formula (5.5.19);
- (R)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[2-fluoro-4-[1-(5-methyl-4H-[1,2,4]triazol-3-yl)-ethoxy]-benzyl]-nicotinamide of Formula (5.5.20);
- (R)-2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-[1-(5-methyl-4H-[1,2,4]triazol-3-yl)-ethoxy]-benzyl]-nicotinamide of Formula (5.5.21);
- 25 (±)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[2-fluoro-4-[1-(1H-tetrazol-5-yl)-ethoxy]-benzyl]-nicotinamide of Formula (5.5.22);
- (R)-2-(Benzo[1,3]dioxol-5-yloxy)-N-[2-fluoro-4-(2-hydroxy-1,2-dimethyl-propoxy)-benzyl]-nicotinamide of Formula (5.5.23);
- (R)-2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(2-hydroxy-1,2-dimethyl-propoxy)-benzyl]-nicotinamide of Formula (5.5.24);
30

(S)-3-[4-({[2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-3-fluorophenoxy]-2-methyl-propionic acid of Formula (5.5.25);

2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(pyridin-2-ylmethoxy)-benzyl]-nicotinamide of Formula (5.5.26);

5 2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(pyridin-4-ylmethoxy)-benzyl]-nicotinamide of Formula (5.5.27);

2-(Benzo[1,3]dioxol-5-yloxy)-5-fluoro-N-[2-fluoro-4-(pyridin-3-ylmethoxy)-benzyl]-nicotinamide of Formula (5.5.28);

10 [4-({[2-(3-Cyano-phenoxy)-pyridine-3-carbonyl]-amino}-methyl)-cyclohex-3-enyloxy]-acetic acid of Formula (5.5.29);

[4-({[2-(2-Methyl-2H-benzotriazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-cyclohex-3-enyloxy]-acetic acid of Formula (5.5.30);

(±)-2-[4-({[2-(Benzo[2,1,3]thiadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-cyclohex-3-enyloxy]-propionic acid of Formula (5.5.31);

15 (±)-2-[4-({[2-(Benzo[2,1,3]oxadiazol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-cyclohex-3-enyloxy]-propionic acid of Formula (5.5.32);

(±)-2-[4-({[2-(Benzo[1,3]dioxol-5-yloxy)-pyridine-3-carbonyl]-amino}-methyl)-cyclohex-3-enyloxy]-propionic acid of Formula (5.5.33);

20 (±)-2-[4-({[2-(4-Fluoro-phenoxy)-pyridine-3-carbonyl]-amino}-methyl)-cyclohex-3-enyloxy]-propionic acid of Formula (5.5.34);

- 277 -

8. A method of treating a subject suffering from a disease or condition mediated by the PDE4 isozyme in its role of regulating the activation and degranulation of human eosinophils, comprising administering to said subject in need of said treatment a therapeutically effective amount of a compound of Formula (1.0.0) as defined in Claim 1.

5

9. A pharmaceutical composition for use in treating a subject suffering from a disease, disorder or condition mediated by the PDE4 isozyme, whereby it regulates the activation and degranulation of eosinophils, comprising a therapeutically effective amount of a compound of Formula (1.0.0) as defined in Claim 1 together with a pharmaceutically acceptable carrier therefor.

10

10. A method of treatment according to Claim 11 wherein said disease, disorder; or condition is a member selected from the group consisting of (1) inflammatory diseases and conditions comprising: joint inflammation, rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, inflammatory bowel disease, ulcerative colitis, chronic glomerulonephritis, dermatitis, and Crohn's disease; (2) respiratory diseases and conditions comprising: asthma, acute respiratory distress syndrome, chronic pulmonary inflammatory disease, bronchitis, chronic obstructive airway disease, and silicosis; (3) infectious diseases and conditions comprising: sepsis, septic shock, endotoxic shock, gram negative sepsis, toxic shock syndrome, fever and myalgias due to bacterial, viral or fungal infection, and influenza; (4) immune diseases and conditions comprising: autoimmune diabetes, systemic lupus erythematosus, graft vs. host reaction, allograft rejections, multiple sclerosis, psoriasis, and allergic rhinitis; and (5) other diseases and conditions comprising: bone resorption diseases; reperfusion injury; cachexia secondary to infection or malignancy; cachexia secondary to human acquired immune deficiency syndrome (AIDS), human immunodeficiency virus (HIV) infection, or AIDS related complex (ARC); keloid formation; scar tissue formation; type 1 diabetes mellitus; and leukemia.

15

20

25

11. The combination of a compound of Formula (1.0.0) as defined in Claim 1 together with one or more members selected from the group consisting of the following:

30

(a) Leukotriene biosynthesis inhibitors, 5-lipoxygenase (5-LO) inhibitors, and 5-lipoxygenase activating protein (FLAP) antagonists selected from the group consisting of zileuton; ABT-761; fenleuton; tepoxalin; Abbott-79175; Abbott-85761; *N*-(5-substituted)-thiophene-2-alkylsulfonamides of Formula (5.2.8); 2,6-di-*tert*-butylphenol hydrazones of Formula (5.2.10); Zeneca ZD-2138 of Formula (5.2.11); SB-210661 of Formula (5.2.12); pyridinyl-

substituted 2-cyanonaphthalene compound L-739,010; 2-cyanoquinoline compound L-746,530; indole and quinoline compounds MK-591, MK-886, and BAY x 1005;

- 5 (b) Receptor antagonists for leukotrienes LTB₄, LTC₄, LTD₄, and LTE₄ selected from the group consisting of phenothiazin-3-one compound L-651,392; amidino compound CGS-25019c; benzoxazoline compound ontazolast; benzenecarboximidamide compound BIIL 284/260; compounds zafirlukast, ablukast, montelukast, pranlukast, verlukast (MK-679), RG-12525, Ro-245913, iralukast (CGP 45715A), and BAY x 7195;
- (c) PDE4 inhibitors and inhibitors of the PDE4 isoform PDE4D;
- 10 (d) 5-Lipoxygenase (5-LO) inhibitors; and 5-lipoxygenase activating protein (FLAP) antagonists;
- (e) Dual inhibitors of 5-lipoxygenase (5-LO) and antagonists of platelet activating factor (PAF);
- (f) Leukotriene antagonists (LTRAs) of LTB₄, LTC₄, LTD₄, and LTE₄;
- 15 (g) Antihistaminic H₁ receptor antagonists cetirizine, loratadine, desloratadine, fexofenadine, astemizole, azelastine, and chlorpheniramine;
- (h) Gastroprotective H₂ receptor antagonists;
- 20 (i) α_1 - and α_2 -adrenoceptor agonist vasoconstrictor sympathomimetic agents administered orally or topically for decongestant use, selected from the group consisting of propylhexedrine, phenylephrine, phenylpropanolamine, pseudoephedrine, naphazoline hydrochloride, oxymetazoline hydrochloride, tetrahydrozoline hydrochloride, xylometazoline hydrochloride, and ethylnorepinephrine hydrochloride;
- (j) one or more α_1 - and α_2 -adrenoceptor agonists as recited in (i) above in combination with one or more inhibitors of 5-lipoxygenase (5-LO) as recited in (a) above;
- 25 (k) Anticholinergic agents ipratropium bromide; tiotropium bromide; oxitropium bromide; pirenzepine; and telenzepine;
- (l) β_1 - to β_4 -adrenoceptor agonists selected from the group consisting of metaproterenol, isoproterenol, isoprenaline, albuterol, salbutamol, formoterol, salmeterol, terbutaline, orciprenaline, bitolterol, and pirbuterol;
- (m) Theophylline and aminophylline;
- 30 (n) Sodium cromoglycate;
- (o) Muscarinic receptor (M1, M2, and M3) antagonists;
- (p) COX-1 inhibitors (NSAIDs); and nitric oxide NSAIDs;

- 279 -

- (q) COX-2 selective inhibitor rofecoxib;
- (r) Insulin-like growth factor type I (IGF-1) mimetics;
- (s) Ciclesonide;
- (t) Inhaled glucocorticoids with reduced systemic side effects selected from the group consisting of prednisone, prednisolone, flunisolide, triamcinolone acetonide, beclomethasone dipropionate, budesonide, fluticasone propionate, and mometasone furoate;
- (u) Tryptase inhibitors;
- (v) Platelet activating factor (PAF) antagonists;
- (w) Monoclonal antibodies active against endogenous inflammatory entities;
- (x) IPL 576;
- (y) Anti-tumor necrosis factor (TNF α) agents selected from the group consisting of etanercept, infliximab, and D2E7;
- (z) DMARDs selected from the group consisting of leflunomide;
- (aa) TCR peptides;
- (bb) Interleukin converting enzyme (ICE) inhibitors;
- (cc) IMPDH inhibitors;
- (dd) Adhesion molecule inhibitors including VLA-4 antagonists;
- (ee) Cathepsins;
- (ff) MAP kinase inhibitors;
- (gg) Glucose-6 phosphate dehydrogenase inhibitors;
- (hh) Kinin-B₁ - and B₂-receptor antagonists;
- (ii) Gold in the form of an aurothio group in combination with hydrophilic groups;
- (jj) Immunosuppressive agents selected from the group consisting of cyclosporine, azathioprine, and methotrexate;
- (kk) Anti-gout agents selected from the group consisting of colchicine;
- (ll) Xanthine oxidase inhibitors selected from the group consisting of allopurinol;
- (mm) Uricosuric agents selected from the group consisting of probenecid, sulfinpyrazone, and benzbromarone;

- 280 -

- (nn)Antineoplastic agents that are antimittotic drugs selected from the group consisting of vinblastine and vincristine;
- (oo)Growth hormone secretagogues;
- (pp)Inhibitors of matrix metalloproteases (MMPs) that are selected from the group consisting of the stromelysins, the collagenases, the gelatinases, aggrecanase, collagenase-1 (MMP-1), collagenase-2 (MMP-8), collagenase-3 (MMP-13), stromelysin-1 (MMP-3), stromelysin-2 (MMP-10), and stromelysin-3 (MMP-11);
- (qq)Transforming growth factor (TGF β);
- (rr) Platelet-derived growth factor (PDGF);
- 10 (ss)Fibroblast growth factor selected from the group consisting of basic fibroblast growth factor (bFGF);
- (tt) Granulocyte macrophage colony stimulating factor (GM-CSF);
- (uu)Capsaicin;
- (vv) Tachykinin NK₁ and NK₃ receptor antagonists selected from the group consisting of NKP-608C; SB-233412 (talnetant); and D-4418;
- 15 (ww) Elastase inhibitors selected from the group consisting of UT-77 and ZD-0892; and
- (xx)Adenosine A2a receptor agonists.

INTERNATIONAL SEARCH REPORT

Inte Application No
PCT/IB 01/02726

A. CLASSIFICATION OF SUBJECT MATTER
IPC 7 C07D405/12 A61K31/44 A61P11/06 A61P29/00

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 7 C07D

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ, BEILSTEIN Data, CHEM ABS Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
P, Y	WO 01 57036 A (MARFAT ANTHONY ; PFIZER PROD INC (US); CHAMBER ROBERT JAMES (US)) 9 August 2001 (2001-08-09) claim 1	1-10
P, Y	WO 01 57025 A (CHAMBERS ROBERT JAMES ; MAGEE THOMAS VICTOR (US); MARFAT ANTHONY (U) 9 August 2001 (2001-08-09) claim 1	1-10
Y	GB 2 327 675 A (EISAI CO LTD) 3 February 1999 (1999-02-03) claims 1, 5	1-10
Y	WO 98 45628 A (NEVREKAR VENKATESH R) 15 October 1998 (1998-10-15) cited in the application claim 2	1-10

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents:

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *&* document member of the same patent family

Date of the actual completion of the international search

INTERNATIONAL SEARCH REPORT

International Application No. PCT/IB 01 02726

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Present claims 1-6 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds where: Y is C(R1) (i.e. pyridines); j is 1; n is 1; W1 is -O-; J1 is an optionally substituted phenyl or benzofused ring; J2 is an optionally substituted phenyl ring. No limitation has been made as regards the remaining substituents in formula (1.0.0). The searched matter covers all of the examples.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
